### ABSTRACT

Type of sets that we will introduce in this research, called nc-open set and present its properties which represent the topological properties of this type . More precisely, we post the sets with each of these properties . At the first , we present the definition of the property and then an illustrative example of this definition . Mean while , we move to the theorems with their proofs and give a counter example to the case that the opposite of the some theorems are not achieved .

*Keywords* : n-open, n-closed, nc-open, nc-closed.

### 1. Introduction

In 2010 [1] , if  $(F \subseteq K$  such that  $K \in SO(H) \forall h \in H, F \in \tau^c$ ) the a subset  $K$  of a top.space  $H_\tau$  is defined by Alias and Zanyar to Ss-open, where top.space denoted to topological space . After that, Zanyar [4] in 2011 improved the notation of Pc-open and Pc-closed via introducing the idea of P-open sets and Bc-open sets are a new class of sets which developed by Hariwan [3] in 2013. Additionally ,C.W.Baker [2] explored the characteristics of the group of the subset of top.space  $H_\tau$ .Which known as n-open sets in 2012. In fact , these sets meet up with provided that its interior and closure are not equal . In the present paper , we introduce a new type of open sets called nc-open and defined some top.properties such as nc-neighborhood, nc-interior( $(K^\circ)^{nc}$  ) ,nc-derived ( $ncD(K)$ ) and nc-closure sets  $(\bar{K})^{nc}$  . Also, we explore the relation between our type and n-open set which developed by C.W.Baked.

**Definition1.1** [4] If  $H_\tau$  is top.space , then the subset  $K$  of  $H_\tau$  is n-open if  $Int(K) \neq Cl(K)$  and it is n-closed if  $K^c$  is n-open . Where the sets of all n-open subsets of  $H_\tau$  denoted by  $nO(H_\tau)$  or  $(nO(H))$  .

## 2.nc-Open Sets

This section contain the main definitions with some results .

**Definition2.1** If  $H_\tau$  is top.space , then the subset  $K$  of  $H_\tau$  called nc-open if  $\forall h \in K \in nO(H)$ ,  $\exists F: h \in F \subseteq K$  and  $F$  is closed . Where the sets of all nc-open subsets of  $H_\tau$  denoted by  $ncO(H_\tau)$  or  $(ncO(H))$

**Example2.2** Consider  $H = \{h_1, h_2, h_3\}$  and  $\tau = \{\varphi, H, \{h_1\}, \{h_2\}, \{h_1, h_2\}\}$  . Then the family of closed set are  $:\{\varphi, H, \{h_3\}, \{h_1, h_3\}, \{h_2, h_3\}\}$  .

So,  $nO(H) = \{\{h_1\}, \{h_2\}, \{h_3\}, \{h_1, h_3\}, \{h_1, h_2\}, \{h_2, h_3\}\}$  and

$ncO(H) = \{\{h_3\}, \{h_1, h_3\}, \{h_2, h_3\}\}$  .

**Remark2.3** From Definition 2.1 , every nc-open subset of  $H_\tau$  is n-open , but the opposite is not true , see Example 2.4.

**Example2.4** Considering the space  $H_\tau$  as defined in Example 2.2 ,  $\{h_1\} \in nO(H)$  but  $\{h_1\} \notin ncO(H)$ .

**Proposition2.5** If  $H_\tau$  is top.space then the subset  $K$  of  $H_\tau$  is nc-open iff  $K$  is n-open and  $K = \cup F_\alpha$  , where  $F_\alpha$  closed sets for each  $\alpha$ .

**Proof:** Since  $K$  is nc-open set . Then  $K$  is n-open set. Let  $h \in K \in nO(H)$ , by definition of nc-open,  $F; h \in F \subseteq K, K = \cup F_\alpha$  , where  $K$  is n-open and  $F$  is closed. Now , let  $h \in K \in nO(H)$ , since  $K = \cup F_\alpha$  where  $F_\alpha$  is closed sets then  $h \in F \subseteq K \rightarrow K$  is nc-open set .

**Remark2.6**nc-open set does not have to be closed .

**Example2.7** The real number  $R$  with ray topology, such that  $K \subseteq R$ , if  $K = (0, \infty)$  such that  $(0, \infty) = \cup_{n=1}^{\infty} [\frac{1}{n}, \infty)$ , then  $K$  is nc-open, but not closed.

**Remark2.8** The union of two nc-open need not to be nc-open .

**Example2.9** Consider  $H = \{h_1, h_2, h_3\}$  with  $\tau = \{\varphi, H, \{h_2\}, \{h_3\}, \{h_2, h_3\}\}$  . Thus the family of closed set are  $:\{\varphi, H, \{h_1\}, \{h_1, h_3\}, \{h_1, h_2\}\}$ . Hence, we obtain

$$nO(H) = \{\{h_1\}, \{h_2\}, \{h_3\}, \{h_1, h_2\}, \{h_1, h_3\}, \{h_2, h_3\}\} \text{ and}$$

$$ncO(H) = \{\{h_1\}, \{h_1, h_2\}, \{h_1, h_3\}\}.$$

There  $\{h_1, h_2\} \in ncO(H)$  and  $\{h_1, h_3\} \in ncO(H)$ , but  $\{h_1, h_2\} \cup \{h_1, h_3\} = H \notin ncO(H)$ .

**Remark2.10** If we have two nc-open, their intersection is not necessarily an nc-open .

**Example2.11** Consider  $H = \{h_1, h_2, h_3\}$  with  $\tau = \{\varphi, H, \{h_3, h_2\}, \{h_1, h_3\}, \{h_3\}\}$ . Then the family of closed set are:  $\{\varphi, H, \{h_1\}, \{h_2\}, \{h_1, h_2\}\}$ . Thus, we deduce that

$$nO(H) = \{\{h_1\}, \{h_2\}, \{h_3\}, \{h_1, h_2\}, \{h_1, h_3\}, \{h_2, h_3\}\} \text{ and } ncO(H) = \{\{h_1\}, \{h_2\}, \{h_1, h_2\}\} \{h_1\} \in ncO(H) \text{ with } \{h_2\} \in ncO(H), \text{ but } \{h_1\} \cap \{h_2\} = \varphi \notin ncO(H).$$

**Remark2.12** The sets of all nc-open set is not topology on H since  $H, \varphi \notin ncO(H)$  .

**Proposition2.13** If  $K$  is nc-open in  $H_\tau$  then  $\forall h \in K, \exists$  nc-open  $B$  such that  $h \in B \subseteq K$

**Proof:** Let  $K$  be nc-open in  $H_\tau$  , then  $\forall h \in K$ , putting  $K = B$  is nc-open containing  $h$  such that  $h \in B \subseteq K$ .

**Theorem2.14** If  $V \subseteq H$  and  $V^* \subseteq H^*$ , then  $V \times V^*$  is nc-open in  $H \times H^*$  iff  $V$  is nc-open in  $V$  or  $V^*$  nc-open in  $H^*$  .

**Proof:** Suppose  $V \times V^*$  is not nc-open in  $H \times H^*$  iff  $V \times V^*$  is clopen in  $H \times H^*$  iff  $V$  is clopen in  $H$  and  $V^*$  is clopen in  $H^*$  iff  $V$  is not nc-open in  $H$  and  $V^*$  is not nc-open in  $H^*$ . Thus,  $V \times V^*$  is nc-open in  $H \times H^*$  iff  $V$  is nc-open in  $H$  or  $V^*$  is nc-open in  $H^*$  .

**Corollary2.15** If  $V \subseteq H$  and  $V^* \subseteq H^*$ . Then  $V \times V^*$  is nc-open in  $H \times H^*$  for all  $V$  and  $V^*$  are nc-open

**Definition2.16** A subset  $M$  of  $H_\tau$  is nc-closed if  $M^c$  is nc-open. The sets of all nc-closed subset of  $H_\tau$  is denoted by  $ncC(H_\tau)$  or  $(ncC(H))$  .

**Example2.17** Considering the space  $H_\tau$  as defined in Example 2.2 then  $ncC(H) = \{\{h_2, h_1\}, \{h_1\}, \{h_2\}\}$  .

**Proposition 2.18** A subset  $M$  of  $H_\tau$  is nc-closed iff  $M$  is the intersection of open sets and it is n-closed

**Proof:** Obvious .

**Remark 2.19** The intersection of two nc-closed does not have to be nc-closed .

**Example 2.20** Considering  $H_\tau$  as defined in Example 2.9 .Then  $ncC(H) = \{\{h_2, h_3\}, \{h_2\}, \{h_3\}\}$ , and  $\{h_3\}, \{h_2\} \in ncC(H)$ , but  $\{h_2\} \cap \{h_3\} = \varphi \notin ncC(H)$  .

**Remark 2.21** The union of two nc-closed does not have to be nc-closed set .

**Example 2.22** Considering  $H_\tau$  as defined in Example 2.11. Then  $ncC(H) = \{\{h_3\}, \{h_1, h_3\}, \{h_2, h_3\}\}$  we have  $\{h_2, h_3\}, \{h_1, h_3\}$  are nc-closed, but  $\{h_2, h_3\} \cup \{h_1, h_3\} = H \notin ncC(H)$  .

**Lemma 2.23** If  $K$  is nc-open and  $K = N \cup M$  , then either  $N$  is nc-open or  $M$  is nc-open .

**Proof:** We have  $K = N \cup M$ ,  $K$  is not nc-open , then either  $N$  is not nc-open or  $M$  is not nc-open . Thus either  $N$  is nc-open or  $M$  is nc-open .

### 3- The Property of nc-Open Sets

Now we will study and defined top.properties of nc-neighborhood ,nc-interior , nc-closure and nc-derived based on the concept of nc-open .

**Definition 3.1** If  $H_\tau$  is top.space and  $h \in H$  , then  $N \subseteq H$  is nc-neighborhood (shortly write nc-neighb.) of  $h$ , if  $\exists$  nc-open  $U$  in  $H$  such that  $h \in U \subseteq N$  .

**Example 3.2** In space  $R_{\tau_u}$  every open interval is nc-neighb. for any point in this interval  $\varphi, R$ .

**Proposition 3.3** A subset  $K$  of  $H_\tau$  is nc-open if it is nc-neighb of each of its points .

**Proof:** Let  $K \subset H$  be nc-open , since  $\forall h \in K, h \in K \subseteq K$  and  $K$  is nc-open . This shows  $K$  is nc-neighb. of each of its points .

**Proposition 3.4** For any two subset  $K$  and  $M$  of  $H_\tau$  and  $K \subset M$ , if  $K$  is nc-neighb. of a point  $h \in H$ , then  $M$  is also nc-neighb. of  $h$ .

**Proof:** Let  $K$  be nc-neighb of a point  $h \in H$ , and  $K \subset M$ , then by Definition 3.1,  $\exists$  nc-open  $U$  such that  $h \in U \subseteq K \subset M \rightarrow M$  is also nc-neighb. of  $h$ .

**Remark 3.5** Every nc-neighb .of any points is n-neighb. Since every nc-open is n-open .

**Definition 3.6** If  $K \subseteq H_\tau$ , and  $h \in H_\tau$  then  $h$  is called nc-interior point of  $K$ , if there exist nc-open  $U$  such that  $h \in U \subseteq K$ . The set of all nc-interior points of  $K$  is called nc-interior of  $K$  and symbolizes it  $(K^\circ)^{nc}$ .

**Example 3.7** Considering  $H_\tau$  as defined in Example 2.2. If we take  $K = \{h_1, h_3\}$ . Then  $(K^\circ)^{nc} = \{h_1, h_3\}$ .

Using Definition (3.1 and 3.6), we can conclude the following result .

**Proposition 3.8** In  $H_\tau$  and  $K \subset H, h \in H$ . The point  $h$  is nc-interior of  $K$  iff  $K$  is nc-neighb . of  $h$ .

**Proposition 3.9** In  $H_\tau$  and  $K \subset H, h \in H$ , if  $h \in (K^\circ)^{nc}$ , then  $\exists F$  closed set , such that  $h \in F \subset K$ .

**Proof:** Let  $h \in (K^\circ)^{nc}$  then  $\exists$  nc-open  $U$  of  $H$  such that  $h \in U \subseteq K$ . Since  $U$  is nc-open, so  $\exists F$  which is closed such that  $h \in F \subset U \rightarrow h \in F \subset K$ .

Next theorem give the properties of nc-interior.

**Theorem 3.10** For a subsets  $K$  and  $M$  of  $H_\tau$ , the following statements hold .

- (i)  $(K^\circ)^{nc} \subset K$ ,
- (ii) if  $K \subset M$  then  $(K^\circ)^{nc} \subset (M^\circ)^{nc}$ ,
- (iii) if  $K$  is nc-open then  $K = (K^\circ)^{nc}$ ,
- (iv)  $((K \cap M)^\circ)^{nc} \subset (K^\circ)^{nc} \cap (M^\circ)^{nc}$ ,
- (v)  $(K^\circ)^{nc} \cup (M^\circ)^{nc} \subset ((K \cup M)^\circ)^{nc}$ ,

(vi)  $ncInt((K^\circ)^{nc}) = (K^\circ)^{nc}$  and  $K$  is nc-open set .

**Proof:** Obvious .

**Proposition 3.11** If  $K$  is a subset of  $H_\tau$  , then  $(K^\circ)^{nc} \subset (K^\circ)^n$  .

**Proof:** Since all nc-open is n-open . In general,  $(K^\circ)^{nc} \neq (K^\circ)^{nc}$  which is shown in 3.12

**Example 3.12** Let  $H = \{h_1, h_2, h_3, h_4\}$  then  $\tau = \{H, \varphi, \{h_1\}, \{h_2\}, \{h_1, h_2\}, \{h_1, h_2, h_3\}$  . Then the closed sets are  $\{\varphi, H, \{h_2, h_3, h_4\}, \{h_1, h_3, h_4\}, \{h_3, h_4\}, \{h_4\}\}$  Thus  $nO(H) = \{\{h_1\}, \{h_2\}, \{h_3\}, \{h_4\}, \{h_1, h_2\}, \{h_1, h_3\}, \{h_1, h_4\}, \{h_2, h_3\}, \{h_2, h_4\}, \{h_3, h_4\},$

$\{h_1, h_2, h_3\}, \{h_1, h_3, h_4\}, \{h_1, h_2, h_4\}, \{h_2, h_3, h_4\}\}$  and  $ncO(H) = \{\{h_2, h_3, h_4\}, \{h_1, h_3, h_4\}, \{h_3, h_4\}, \{h_4\}\}$  . Let  $K = \{h_2, h_4\}$  , then  $(K^\circ)^{nc} = \{h_4\}$  and  $(K^\circ)^n = K$  . This shows that  $(K^\circ)^{nc} \neq (K^\circ)^n$  .

If  $(K^\circ)^{nc} = (M^\circ)^{nc} \not\Rightarrow K = M$ , as it is shown in 3.13

**Example 3.13** If we have  $H_\tau$  as defined in Example 3.12

Such that  $K = \{h_1, h_4\}$  and  $M = \{h_2, h_4\}$  , then we obtain that,  $(K^\circ)^{nc} = (M^\circ)^{nc} = \{h_4\}$  .

**Definition 3.14** Let  $K \subseteq H_\tau$  then  $h \in H$  is nc-limit point of  $K$  if for all nc-open  $U$  containing  $h$  and  $U \cap K \setminus \{h\} \neq \varphi$  . Then nc-derived of  $K$  are the set of all nc-limit points of  $K$  and symbolizes it  $ncD(K)$  .

**Example 3.15** Considering the space  $H_\tau$  as defined in Example 2.9.

$Z = \{h_1, h_2\}, V = \{h_1, h_3\}$ . Then we see that  $ncD(Z) = \{h_2, h_3\}$  and  $ncD(V) = \{h_2, h_3\}$

.

**Proposition 3.16** Let  $F \subset H_\tau$  be any containing  $h$  such that  $F \cap (K \setminus \{h\}) \neq \varphi$ , then  $h$  is nc-limit point of  $K$ .

**Proof:** Let  $h \in U$  be any nc-open , then for all  $h \in U \in nO(H), \exists$  closed set  $F$  such that  $h \in F \subseteq U$  . Since we have  $F \cap (K \setminus \{h\}) \neq \varphi$  . Thus  $U \cap (K \setminus \{h\}) \neq \varphi$  . So a point  $h \in H$  is nc-limit point of  $K$  .

Next theorem gives the properties of nc-derived .

**Theorem3.17** For subset  $K$  and  $M$  of  $H_\tau$  , the following statements hold .

- (i) If  $K \subset M$  then  $ncD(K) \subset ncD(M)$ ,
- (ii)  $ncD(K) \cup ncD(M) \subset ncD(K \cup M)$ ,
- (iii)  $ncD(K \cap M) \subset ncD(K) \cap ncD(M)$ ,
- (iv)  $ncD(K \cup ncD(K)) \subset K \cup ncD(K)$ ,
- (v) If  $h \in ncD(K)$ , then  $h \in ncD(K \setminus \{h\})$  and  $ncD(\varnothing) = \varnothing$ .

**Proof:**(iv) Let  $h \in ncD(K \cup ncD(K))$  if  $h \in K$ , then result is obvious . Now let  $h \in ncD(K \cup ncD(K)) \setminus K$ , there for nc-open  $U$  containing  $h$  and  $U \cap (K \cup ncD(K)) \setminus \{h\} \neq \varnothing$  . Thus,  $U \cap (K \setminus \{h\}) \neq \varnothing$  or  $U \cap (ncD(K) \setminus \{h\}) \neq \varnothing$ .  $U \cap (K \setminus \{h\}) \neq \varnothing$ , hence  $h \in ncD(K)$  . Therefore, in any case  $ncD(K) \cup ncD(K) \subset K \cup ncD(K)$ .

The proof of other parts is obvious.

If  $ncD(K) = ncD(M) \not\Rightarrow K = M$  , as it shown in the following example .

**Example3.18** Considering  $H_\tau$  as defined in Example 3.12.

If  $K = \{h_1, h_3, h_4\}$  and  $M = \{h_2, h_3, h_4\}$  . Then we obtain that  $ncD(K) = ncD(M) = \{h_1, h_2, h_3\}$  .

**Corollary3.19** If  $K \subset H_\tau$ , then  $nD(K) \subset ncD(K)$ .

**Proof:** It is enough to remember that every nc-open is n-open .

In general, the converse may not be true as shown in following example .

**Example3.20** Considering  $H_\tau$  as defined in Example 3.12.

If  $K = \{h_1, h_2, h_3\}$  . So  $ncD(K) = \{h_1, h_2\}$  and  $nD(K) = \varnothing$ . Hence,  $ncD(K) \not\subset nD(K)$  .

**Definition3.21** Let  $K$  be a subset of  $H_\tau$ . The nc-closure of a set  $K$  is  $K \cup ncD(K)$  and denoted by  $\bar{K}^{nc}$  i.e.  $\bar{K}^{nc} = K \cup ncD(K)$ .

**Example3.22** Considering the space  $H_\tau$  as defined in Example 2.9. Then

$$ncC(H) = \{\{h_2\}, \{h_3\}, \{h_2, h_3\}\}, N = \{h_2\}, (\bar{N})^{nc} = \{h_2\}.$$

**Proposition3.23** A subset  $K$  of  $H_\tau$  is nc-closed iff it contains the set of its nc-limit points .

**Proof:** Let  $K$  be nc-closed and if  $h$  is a nc-limit point of  $K$  and  $h \in K^c$ , then  $K^c$  is nc-open containing nc-limit points of  $K$ . Therefore  $K \cap K^c \neq \varnothing$ , which is a contradiction .

Conversely, suppose that  $K$  contains all of its nc-limit points  $\forall h \in K^c$ , there exists nc-open  $U$  containing  $h$  such that  $K \cap U = \varnothing$ , thus  $h \in U \subset K^c$  by Proposition 2.13,  $K^c$  is nc-open and  $K$  is nc-closed .

**Proposition3.24** Let  $K \subset H_\tau$  if  $K \cap F \neq \varnothing$  for all closed  $F$  of  $H_\tau$  containing  $h$ , then  $h \in \bar{K}^{nc}$  .

**Proof:** Let  $h \in U$  such that  $U$  any nc-open , then by 2.1,  $\exists F$  which is closed such that  $h \in F \subseteq U$  .We have  $K \cap F \neq \varnothing$  implies  $K \cap U \neq \varnothing, \forall$  nc-open  $U$  containing  $h$ . Therefore  $h \in \bar{K}^{nc}$ .

We show the properties of nc-closure of sets .

**Theorem3.25** For subsets  $K$  and  $M$  of  $H_\tau$ , the following statements are true .

(i)  $K \subset \bar{K}^{nc}$ ,

(ii) if  $K \subset M$  then  $\bar{K}^{nc} \subset \bar{M}^{nc}$ ,

(iii)  $(\bar{K})^{nc} \cup (\bar{M})^{nc} \subset \overline{(K \cup M)}^{nc}$ ,

(iv)  $\overline{(K \cap M)}^{nc} \subset (\bar{K})^{nc} \subset (\bar{M})^{nc}$ ,

(v) if  $K$  is nc-closed then  $(\bar{K})^{nc} = K$ ,

(vi) The nc-closure of  $K$  is the intersection of all nc-closed sets containing  $h$ .

**Proof:** Obvious.

**Proposition3.26** let  $K \subset H_\tau$  then the following statement are true .

$$(i) H \setminus ncCl(K) = ncInt(H \setminus K),$$

$$(ii) H \setminus ncInt(K) = ncCl(H \setminus K),$$

$$(iii) \bar{K}^{nc} = H \setminus ncInt(H \setminus K),$$

$$(iv) (K^\circ)^{nc} = H \setminus ncCl(H \setminus K).$$

**Proof:** (i) For any point  $h \in H$  then  $h \in H \setminus \bar{K}^{nc}$  implies that  $h \notin \bar{K}^{nc}$ . Then for each  $G \in ncO(H)$  containing  $h$ , we find that  $K \cap G = \varnothing$ , then  $h \in G \subset H \setminus K$ . Thus,  $h \in ncInt(H \setminus K)$ .

Conversely, we can prove these part by reverse the above steps .

Similarly, the other branch can be proved .

**Conclusion** As a factual information , this article has some important result which wrote as follows (i) Every nc-open subset of  $H$  is n-open but the opposite is not always true.

(ii) The union of two nc-open does not need to be nc-open .

(iii) The intersection of two nc-closed does not have to be nc-closed .
