Abstract:

In this paper we introduced a new class of fuzzy closed sets called fuzzy $g\alpha g$ -closed sets and study their basic properties in fuzzy topological spaces. We also introduced fuzzy $g\alpha g$ -continuous functions with some of its properties. Moreover, the investigation will include some of the properties of the fuzzy separation axioms such fuzzy $g\alpha g$ - R_i -space and fuzzy $g\alpha g$ - T_j -space (note that, the indexes i and j are natural numbers of the spaces R and T are from 0 to 1 and from 0 to 2 respectively).

Mathematics Subject Classification (2010): 54A40.

Keywords: Fgag-closed set, Fgag-continuous functions, Fgag- R_i -space, $i = 0,1$ and Fgag- T_j -space, $j = 0,1,2$.

الخلاصة:

في هذا البحث قدمنا فئة جديدة من المجموعات المغلقة الضبابية تسمى بالمجموعات المعممة ألفا المعممة المغلقة الضبابية ودراسة خصائصها الأساسية في الفضاءات التبولوجية الضبابية. قدمنا أيضا الدوال المعممة ألفا المعممة المستمرة الضبابية مع بعض خصائصها. علاوة على ذلك، سيشمل تحقيق بعض خصائص بديهيات الفصل الضبابية مثل فضاء $g\alpha g$ - R_i الضبابي و فضاء $g\alpha g$ - T_j الضبابي (لاحظ أن المؤشرات i و j هي اعداد طبيعية من الفضاءات R و T هي من 0 إلى 1 ومن 0 إلى 2 على التوالي).

1. Introduction

In 1965 Zadeh studied the fuzzy sets (briefly F-sets) (see [5]) which plays such a role in the field of fuzzy topological spaces (or simply FTS). The fuzzy topological spaces investigated by Chang in 1968 (see [2]). A. S. Bin Shahna [1] defined fuzzy α -closed sets. In 1997, fuzzy generalized closed set (briefly Fg-CS) was introduced by G. Balasubramania and P. Sundaram [4]. S. Kalaiselvi and V. Seenivasan [12] introduced the concept of fuzzy gsg-closed sets in FTS. The purpose of this paper is to introduce the concept of fuzzy $g\alpha g$ -closed sets and study their basic properties in FTS. We also introduce fuzzy $g\alpha g$ -continuous functions by using fuzzy $g\alpha g$ -closed sets and study some of their fundamental properties. Furthermore, the investigation will include some of the properties of the fuzzy separation axioms such fuzzy $g\alpha g$ - R_i -space and fuzzy $g\alpha g$ - T_j -space (here the indexes i and j are natural numbers of the spaces R and T are from 0 to 1 and from 0 to 2 respectively).

2. Preliminaries

Throughout this paper, (X, τ) , (Y, ψ) and (Z, ρ) (or simply X, Y and Z) always mean FTS on which no separation axioms are assumed unless otherwise mentioned. A fuzzy point [3] with support $x \in X$ and value λ ($0 < \lambda \leq 1$) at $x \in X$ will be denoted by x_λ , and for F-set \mathcal{M} , $x_\lambda \in \mathcal{M}$ iff $\lambda \leq \mathcal{M}(x)$. Two fuzzy points x_λ and y_μ are said to be distinct iff their supports are distinct. That is, by 0_X and 1_X we mean the constant F-sets taking the values 0 and 1 on X , respectively. For a F-set \mathcal{M} in a FTS (X, τ) , $cl(\mathcal{M})$, $int(\mathcal{M})$ and $\mathcal{M}^c = 1_X - \mathcal{M}$ denote the fuzzy closure of \mathcal{M} , the fuzzy interior of \mathcal{M} and the fuzzy complement of \mathcal{M} respectively.

Definition 2.1:[11] A fuzzy point in a set X with support x and membership value 1 is called crisp point, denoted by x_1 . For any F-set \mathcal{M} in X , we have $x_1 \in \mathcal{M}$ iff $\mathcal{M}(x) = 1$.

Proposition 2.2:[10] Let $\mathcal{M}, \mathcal{N}, \mathcal{O}$ be F-sets in a FTS (X, τ) . Then $\mathcal{M}q(\mathcal{N} \vee \mathcal{O})$ iff $\mathcal{M}q\mathcal{N}$ or $\mathcal{M}q\mathcal{O}$.

Definition 2.3:[6] A fuzzy point $x_\lambda \in \mathcal{M}$ is called quasi-coincident (briefly q -coincident) with the F-set \mathcal{M} is denoted by $x_\lambda q\mathcal{M}$ iff $\lambda + \mathcal{M}(x) > 1$. A F-set \mathcal{M} in a FTS (X, τ) is called q -coincident with a F-set \mathcal{N} which is denoted by $\mathcal{M}q\mathcal{N}$ iff there exists $x \in X$ such that $\mathcal{M}(x) + \mathcal{N}(x) > 1$. If the F-sets \mathcal{M} and \mathcal{N} in a FTS (X, τ) are not q -coincident then we write $\mathcal{M}\bar{q}\mathcal{N}$. Note that $\mathcal{M} \leq \mathcal{N} \Leftrightarrow \mathcal{M}\bar{q}(1_X - \mathcal{N})$.

Definition 2.4:[6] A F-set \mathcal{M} in a FTS (X, τ) is called q -neighbourhood (briefly q -nhd) of a fuzzy point x_λ (resp. F-set \mathcal{N}) if there is a F-OS \mathcal{A} in a FTS (X, τ) such that $x_\lambda q\mathcal{A} \leq \mathcal{M}$ (resp. $\mathcal{N}q\mathcal{A} \leq \mathcal{M}$).

Proposition 2.5:[4,7] Let \mathcal{M}, \mathcal{N} be two F-sets in a FTS (X, τ) . Then the following properties hold:

- (i) \mathcal{M} is a F-OS iff $\mathcal{M} = \text{int}(\mathcal{M})$.
- (ii) \mathcal{M} is a F-CS iff $\mathcal{M} = \text{cl}(\mathcal{M})$.
- (iii) $\text{int}(\mathcal{M}) \leq \mathcal{M}$, $\text{int}(\text{int}(\mathcal{M})) = \text{int}(\mathcal{M})$.
- (iv) $\text{int}(\mathcal{M}) \leq \text{int}(\mathcal{N})$, whenever $\mathcal{M} \leq \mathcal{N}$.
- (v) $\text{int}(\mathcal{M} \wedge \mathcal{N}) = \text{int}(\mathcal{M}) \wedge \text{int}(\mathcal{N})$, $\text{int}(\mathcal{M} \vee \mathcal{N}) \geq \text{int}(\mathcal{M}) \vee \text{int}(\mathcal{N})$.
- (vi) $\mathcal{M} \leq \text{cl}(\mathcal{M})$, $\text{cl}(\text{cl}(\mathcal{M})) = \text{cl}(\mathcal{M})$.
- (vii) $\text{cl}(\mathcal{M}) \leq \text{cl}(\mathcal{N})$, whenever $\mathcal{M} \leq \mathcal{N}$.
- (viii) $\text{cl}(\mathcal{M} \wedge \mathcal{N}) \leq \text{cl}(\mathcal{M}) \wedge \text{cl}(\mathcal{N})$, $\text{cl}(\mathcal{M} \vee \mathcal{N}) = \text{cl}(\mathcal{M}) \vee \text{cl}(\mathcal{N})$.

Lemma 2.6:[7] Let \mathcal{M} be any F-set in a FTS (X, τ) . Then the following properties hold:

- (i) $\text{cl}(1_X - \mathcal{M}) = 1_X - \text{int}(\mathcal{M})$.
- (ii) $\text{int}(1_X - \mathcal{M}) = 1_X - \text{cl}(\mathcal{M})$.

Definition 2.7:[2] Let X and Y be two non-empty sets, and $f: (X, \tau) \rightarrow (Y, \psi)$ be a function. If \mathcal{M} is a F-set of X and \mathcal{N} is a F-set of Y , then:

- (i) $f(\mathcal{M})$ is a F-set of Y , where

$$f(\mathcal{M}) = \begin{cases} \sup_{x \in f^{-1}(y)} \mathcal{M}(x), & \text{if } f^{-1}(y) \neq \emptyset, \\ 0, & \text{otherwise} \end{cases}$$

for every $y \in Y$.

- (ii) $f^{-1}(\mathcal{N})$ is a F-set of X , where $f^{-1}(\mathcal{N})(x) = \mathcal{N}(f(x))$ for each $x \in X$.
- (iii) $f^{-1}(1_Y - \mathcal{N}) = 1_X - f^{-1}(\mathcal{N})$.

Theorem 2.8:[2] Let X and Y be two non-empty sets, and $f: (X, \tau) \rightarrow (Y, \psi)$ be a function, then:

- (i) $f^{-1}(\mathcal{N}^c) = (f^{-1}(\mathcal{N}))^c$, for any F-set \mathcal{N} in Y .
- (ii) $f(f^{-1}(\mathcal{N})) \leq \mathcal{N}$, for any F-set \mathcal{N} in Y .
- (iii) $\mathcal{M} \leq f^{-1}(f(\mathcal{M}))$, for any F-set \mathcal{M} in X .

Definition 2.9:[1] A F-set \mathcal{M} of a FTS (X, τ) is said to be a fuzzy α -open set (briefly F α -OS) if $\mathcal{M} \leq \text{int}(\text{cl}(\text{int}(\mathcal{M})))$ and a fuzzy α -closed set (briefly F α -CS) if $\text{cl}(\text{int}(\text{cl}(\mathcal{M}))) \leq \mathcal{M}$. The fuzzy α -closure of a F-set \mathcal{M} of a FTS (X, τ) is the intersection of all F α -CS that contain \mathcal{M} and is denoted by $\alpha\text{cl}(\mathcal{M})$.

Definition 2.10:[4] A F-set \mathcal{M} of a FTS (X, τ) is said to be a fuzzy g -closed set (briefly F g -CS) if $\text{cl}(\mathcal{M}) \leq \mathcal{U}$ whenever $\mathcal{M} \leq \mathcal{U}$ and \mathcal{U} is a F-OS in X . The complement of a F g -CS in X is a F g -OS in X .

Definition 2.11:[9] A F-set \mathcal{M} of a FTS (X, τ) is said to be a fuzzy αg -closed set (briefly $F\alpha g$ -CS) if $\alpha cl(\mathcal{M}) \leq \mathcal{U}$ whenever $\mathcal{M} \leq \mathcal{U}$ and \mathcal{U} is a $F\alpha$ -OS in X . The complement of a $F\alpha g$ -CS in X is a $F\alpha g$ -OS in X .

Definition 2.12:[8] A F-set \mathcal{M} of a FTS (X, τ) is said to be a fuzzy $g\alpha$ -closed set (briefly $Fg\alpha$ -CS) if $\alpha cl(\mathcal{M}) \leq \mathcal{U}$ whenever $\mathcal{M} \leq \mathcal{U}$ and \mathcal{U} is a F-OS in X . The complement of a $Fg\alpha$ -CS in X is a $Fg\alpha$ -OS in X .

Theorem 2.13:[1,4] In a FTS (X, τ) , then the following statements hold and the converse of each statements are not true:

- (i) Every F-OS (resp. F-CS) is a $F\alpha$ -OS (resp. $F\alpha$ -CS).
- (ii) Every F-OS (resp. F-CS) is a Fg -OS (resp. Fg -CS).

Theorem 2.14:[8,9] In a FTS (X, τ) , then the following statements hold and the converse of each statements are not true:

- (i) Every F-OS (resp. F-CS) is a $F\alpha g$ -OS (resp. $F\alpha g$ -CS).
- (ii) Every Fg -OS (resp. Fg -CS) is a $Fg\alpha$ -OS (resp. $Fg\alpha$ -CS).
- (iii) Every $F\alpha$ -OS (resp. $F\alpha$ -CS) is a $F\alpha g$ -OS (resp. $F\alpha g$ -CS).
- (iv) Every $F\alpha g$ -OS (resp. $F\alpha g$ -CS) is a $Fg\alpha$ -OS (resp. $Fg\alpha$ -CS).

Definition 2.15:[4] A FTS (X, τ) is said to be a fuzzy $T_{\frac{1}{2}}$ -space (briefly $FT_{\frac{1}{2}}$ -space) if every Fg -CS in it is a F-CS.

Definition 2.16: Let (X, τ) and (Y, ψ) be FTS. Then the function $f: (X, \tau) \rightarrow (Y, \psi)$ is called:

- (i) F-continuous [2] if $f^{-1}(\mathcal{V})$ is a F-OS (resp. F-CS) set in X , for each F-OS (resp. F-CS) \mathcal{V} in Y .
- (ii) $F\alpha$ -continuous [1] if $f^{-1}(\mathcal{V})$ is a $F\alpha$ -OS (resp. $F\alpha$ -CS) in X , for each F-OS (resp. F-CS) \mathcal{V} in Y .
- (iii) Fg -continuous [4] if $f^{-1}(\mathcal{V})$ is a Fg -OS (resp. Fg -CS) in X , for each F-OS (resp. F-CS) \mathcal{V} in Y .
- (iv) $F\alpha g$ -continuous [9] if $f^{-1}(\mathcal{V})$ is a $F\alpha g$ -OS (resp. $F\alpha g$ -CS) in X , for each F-OS (resp. F-CS) \mathcal{V} in Y .
- (v) $Fg\alpha$ -continuous [8] if $f^{-1}(\mathcal{V})$ is a $Fg\alpha$ -OS (resp. $Fg\alpha$ -CS) in X , for each F-OS (resp. F-CS) \mathcal{V} in Y .

Theorem 2.17:[1,4] Let $f: (X, \tau) \rightarrow (Y, \psi)$ be a function. Then the following statements hold and the converse of each statements are not true:

- (i) Every F-continuous function is a $F\alpha$ -continuous.
- (ii) Every F-continuous function is a Fg -continuous.

Theorem 2.18:[8,9] Let $f: (X, \tau) \rightarrow (Y, \psi)$ be a function. Then the following statements hold and the converse of each statements are not true:

- (i) Every Fg -continuous function is a $Fg\alpha$ -continuous.
- (ii) Every $F\alpha$ -continuous function is a $F\alpha g$ -continuous.
- (iii) Every $F\alpha g$ -continuous function is a $Fg\alpha$ -continuous.

3. Fuzzy $g\alpha g$ -Closed Sets

Definition 3.1: A F-set \mathcal{M} of a FTS (X, τ) is said to be a fuzzy generalized αg -closed set (briefly $Fg\alpha g$ -CS) if $cl(\mathcal{M}) \leq \mathcal{U}$ whenever $\mathcal{M} \leq \mathcal{U}$ and \mathcal{U} is a $F\alpha g$ -OS in X . The family of all $Fg\alpha g$ -CS of a FTS (X, τ) is denoted by $Fg\alpha g-C(X)$.

Example 3.2: Let $X = \{a, b\}$ and the F-set \mathcal{M} in X defined as follows: $\mathcal{M}(a) = 0.5, \mathcal{M}(b) = 0.5$. Let $\tau = \{0_X, \mathcal{M}, 1_X\}$ be a FTS. Then the F-sets $0_X, \mathcal{M}$ and 1_X are $Fg\alpha g$ -CS in X .

Definition 3.3: The intersection of all $Fg\alpha g$ -CS in a FTS (X, τ) containing \mathcal{M} is called fuzzy $g\alpha g$ -closure of \mathcal{M} and is denoted by $g\alpha g-cl(\mathcal{M})$, $g\alpha g-cl(\mathcal{M}) = \bigwedge \{N: \mathcal{M} \leq N, N \text{ is a } Fg\alpha g\text{-CS}\}$.

Theorem 3.4: In a FTS (X, τ) , then the following statements are true:

- (i) Every F-CS is a Fgag-CS.
- (ii) Every Fgag-CS is a Fg-CS.
- (iii) Every Fgag-CS is a Fag-CS.
- (iv) Every Fgag-CS is a Fg α -CS.

Proof: (i) Let \mathcal{M} be a F-CS in a FTS (X, τ) and let \mathcal{U} be any Fag-OS containing \mathcal{M} . Then $cl(\mathcal{M}) = \mathcal{M} \leq \mathcal{U}$. Hence \mathcal{M} is a Fgag-CS.

(ii) Let \mathcal{M} be a Fgag-CS in a FTS (X, τ) and let \mathcal{U} be any F-OS containing \mathcal{M} . By theorem (2.14) part (i), \mathcal{U} is a Fag-OS in X . Since \mathcal{M} is a Fgag-CS, we have $cl(\mathcal{M}) \leq \mathcal{U}$. Hence \mathcal{M} is a Fg-CS.

(iii) Let \mathcal{M} be a Fgag-CS in a FTS (X, τ) and let \mathcal{U} be any F α -OS containing \mathcal{M} . By theorem (2.14) part (iii), \mathcal{U} is a Fag-OS in X . Since \mathcal{M} is a Fgag-CS, we have $acl(\mathcal{M}) \leq cl(\mathcal{M}) \leq \mathcal{U}$. Hence \mathcal{M} is a Fag-CS.

(iv) Let \mathcal{M} be a Fgag-CS in a FTS (X, τ) and let \mathcal{U} be any F-OS containing \mathcal{M} . By theorem (2.14) part (i), \mathcal{U} is a Fag-OS in X . Since \mathcal{M} is a Fgag-CS, we have $acl(\mathcal{M}) \leq cl(\mathcal{M}) \leq \mathcal{U}$. Hence \mathcal{M} is a Fg α -CS.

The converse of the above theorem need not be true as shown in the following examples.

Example 3.5: Let $X = \{x, y, z\}$ and the F-sets \mathcal{M}, \mathcal{N} and \mathcal{O} from X to $[0,1]$ be defined as: $\mathcal{M}(x) = 0.0, \mathcal{M}(y) = 0.0, \mathcal{M}(z) = 0.4$; $\mathcal{N}(x) = 0.9, \mathcal{N}(y) = 0.6, \mathcal{N}(z) = 0.0$; $\mathcal{O}(x) = 1.0, \mathcal{O}(y) = 0.7, \mathcal{O}(z) = 1.0$. Let $\tau = \{0_X, \mathcal{M}, \mathcal{N}, \mathcal{M} \vee \mathcal{N}, 1_X\}$ be a FTS. Then the F-set \mathcal{O} is a Fgag-CS but not F-CS in X .

Example 3.6: Let $X = \{x, y, z\}$ and the F-sets $\mathcal{M}, \mathcal{N}, \mathcal{O}$ and \mathcal{P} from X to $[0,1]$ be defined as: $\mathcal{M}(x) = 0.7, \mathcal{M}(y) = 0.3, \mathcal{M}(z) = 1.0$; $\mathcal{N}(x) = 0.7, \mathcal{N}(y) = 0.0, \mathcal{N}(z) = 0.0$; $\mathcal{O}(x) = 0.9, \mathcal{O}(y) = 0.2, \mathcal{O}(z) = 0.1$; $\mathcal{P}(x) = 0.2, \mathcal{P}(y) = 0.7, \mathcal{P}(z) = 0.2$. Let $\tau = \{0_X, \mathcal{M}, \mathcal{N}, 1_X\}$ be a FTS. Then the F-set \mathcal{O} is a Fg-CS and hence Fg α -CS, but not Fgag-CS in X . And the F-set \mathcal{P} is a Fag-CS but not Fgag-CS in X .

Definition 3.7: A F-set \mathcal{M} of a FTS (X, τ) is said to be a fuzzy generalized ag-open set (briefly Fgag-open set) iff $1_X - \mathcal{M}$ is a Fgag-CS. The family of all Fgag-open sets of a FTS (X, τ) is denoted by Fgag- $O(X)$.

Example 3.8: By example (3.2). Then the F-sets $0_X, \mathcal{M}$ and 1_X are Fgag-OS in X .

Definition 3.9: The union of all Fgag-OS in a FTS (X, τ) contained in \mathcal{M} is called fuzzy gag-interior of \mathcal{M} and is denoted by gag-int(\mathcal{M}), $gag-int(\mathcal{M}) = \vee \{\mathcal{N} : \mathcal{M} \geq \mathcal{N}, \mathcal{N} \text{ is a Fgag-OS}\}$.

Proposition 3.10: Let \mathcal{M} be any F-set in a FTS (X, τ) . Then the following properties hold:

- (i) $gag-int(\mathcal{M}) = \mathcal{M}$ iff \mathcal{M} is a Fgag-OS.
- (ii) $gag-cl(\mathcal{M}) = \mathcal{M}$ iff \mathcal{M} is a Fgag-CS.
- (iii) $gag-int(\mathcal{M})$ is the largest Fgag-OS contained in \mathcal{M} .
- (iv) $gag-cl(\mathcal{M})$ is the smallest Fgag-CS containing \mathcal{M} .

Proof: (i), (ii), (iii) and (iv) are obvious.

Proposition 3.11: Let \mathcal{M} be any F-set in a FTS (X, τ) . Then the following properties hold:

- (i) $gag-int(1_X - \mathcal{M}) = 1_X - (gag-cl(\mathcal{M}))$,
- (ii) $gag-cl(1_X - \mathcal{M}) = 1_X - (gag-int(\mathcal{M}))$.

Proof: (i) By definition, $gag-cl(\mathcal{M}) = \wedge \{\mathcal{N} : \mathcal{M} \leq \mathcal{N}, \mathcal{N} \text{ is a Fgag-CS}\}$

$$\begin{aligned} 1_X - (gag-cl(\mathcal{M})) &= 1_X - \wedge \{\mathcal{N} : \mathcal{M} \leq \mathcal{N}, \mathcal{N} \text{ is a Fgag-CS}\} \\ &= \vee \{1_X - \mathcal{N} : \mathcal{M} \leq \mathcal{N}, \mathcal{N} \text{ is a Fgag-CS}\} \\ &= \vee \{\mathcal{U} : 1_X - \mathcal{M} \geq \mathcal{U}, \mathcal{U} \text{ is a Fgag-OS}\} \end{aligned}$$

$$= \text{gag-int}(1_X - \mathcal{M})$$

(ii) The proof is similar to (i).

Theorem 3.12: Let (X, τ) be a FTS. If \mathcal{M} is a F-OS, then it is a Fgag-OS in X .

Proof: Let \mathcal{M} be a F-OS in a FTS (X, τ) , then $1_X - \mathcal{M}$ is a F-CS in X . By theorem (3.4) part (i), $1_X - \mathcal{M}$ is a Fgag-CS. Hence \mathcal{M} is a Fgag-OS in X .

Theorem 3.13: Let (X, τ) be a FTS. If \mathcal{M} is a Fgag-OS, then it is a Fg-OS in X .

Proof: Let \mathcal{M} be a Fgag-OS in a FTS (X, τ) , then $1_X - \mathcal{M}$ is a Fgag-CS in X . By theorem (3.4) part (ii), $1_X - \mathcal{M}$ is a Fg-CS. Hence \mathcal{M} is a Fg-OS in X .

Lemma 3.14: Let (X, τ) be a FTS. If \mathcal{M} is a Fgag-OS, then it is a Fag-OS (resp. Fg α -OS) in X .

Proof: Similar to above theorem.

Proposition 3.15: If \mathcal{M} and \mathcal{N} are Fgag-CS in a FTS (X, τ) , then $\mathcal{M} \vee \mathcal{N}$ is a Fgag-CS.

Proof: Let \mathcal{M} and \mathcal{N} be Fgag-CS in a FTS (X, τ) and let \mathcal{U} be any Fag-OS containing \mathcal{M} and \mathcal{N} . Then $\mathcal{M} \vee \mathcal{N} \leq \mathcal{U}$. Then $\mathcal{M} \leq \mathcal{U}$ and $\mathcal{N} \leq \mathcal{U}$. Since \mathcal{M} and \mathcal{N} are Fgag-CS, $cl(\mathcal{M}) \leq \mathcal{U}$ and $cl(\mathcal{N}) \leq \mathcal{U}$. Now, $cl(\mathcal{M} \vee \mathcal{N}) = cl(\mathcal{M}) \vee cl(\mathcal{N}) \leq \mathcal{U}$ and so $cl(\mathcal{M} \vee \mathcal{N}) \leq \mathcal{U}$. Hence $\mathcal{M} \vee \mathcal{N}$ is a Fgag-CS.

Proposition 3.16: If \mathcal{M} and \mathcal{N} are Fgag-OS in a FTS (X, τ) , then $\mathcal{M} \wedge \mathcal{N}$ is a Fgag-OS.

Proof: Let \mathcal{M} and \mathcal{N} be Fgag-OS in a FTS (X, τ) . Then $1_X - \mathcal{M}$ and $1_X - \mathcal{N}$ are Fgag-CS. By proposition (3.15), $(1_X - \mathcal{M}) \vee (1_X - \mathcal{N})$ is a Fgag-CS. Since $(1_X - \mathcal{M}) \vee (1_X - \mathcal{N}) = 1_X - (\mathcal{M} \wedge \mathcal{N})$. Hence $\mathcal{M} \wedge \mathcal{N}$ is a Fgag-OS.

Proposition 3.17: If a F-set \mathcal{M} is Fgag-CS in a FTS (X, τ) , then $cl(\mathcal{M}) - \mathcal{M}$ contains no non-empty F-CS in X .

Proof: Let \mathcal{M} be a Fgag-CS in a FTS (X, τ) and let \mathcal{F} be any F-CS in X such that $\mathcal{F} \leq cl(\mathcal{M}) - \mathcal{M}$. Since \mathcal{M} is a Fgag-CS, we have $cl(\mathcal{M}) \leq 1_X - \mathcal{F}$. This implies $\mathcal{F} \leq 1_X - cl(\mathcal{M})$. Then $\mathcal{F} \leq cl(\mathcal{M}) \wedge (1_X - cl(\mathcal{M})) = 0_X$. Thus, $\mathcal{F} = 0_X$. Hence $cl(\mathcal{M}) - \mathcal{M}$ contains no non-empty F-CS in X .

Proposition 3.18: If a F-set \mathcal{M} is Fgag-CS in a FTS (X, τ) , then $cl(\mathcal{M}) - \mathcal{M}$ contains no non-empty Fag-CS in X .

Proof: Let \mathcal{M} be a Fgag-CS in a FTS (X, τ) and let \mathcal{D} be any Fag-CS in X such that $\mathcal{D} \leq cl(\mathcal{M}) - \mathcal{M}$. Since \mathcal{M} is a Fgag-CS, we have $cl(\mathcal{M}) \leq 1_X - \mathcal{D}$. This implies $\mathcal{D} \leq 1_X - cl(\mathcal{M})$. Then $\mathcal{D} \leq cl(\mathcal{M}) \wedge (1_X - cl(\mathcal{M})) = 0_X$. Thus, $\mathcal{D} = 0_X$. Hence $cl(\mathcal{M}) - \mathcal{M}$ contains no non-empty Fag-CS in X .

Theorem 3.19: If \mathcal{M} is a Fag-OS and a Fgag-CS in a FTS (X, τ) , then \mathcal{M} is a F-CS in X .

Proof: Suppose that \mathcal{M} is a Fag-OS and a Fgag-CS in a FTS (X, τ) , then $cl(\mathcal{M}) \leq \mathcal{M}$ and since $\mathcal{M} \leq cl(\mathcal{M})$. Thus, $cl(\mathcal{M}) = \mathcal{M}$. Hence \mathcal{M} is a F-CS.

Theorem 3.20: If \mathcal{M} is a Fgag-CS in a FTS (X, τ) and $\mathcal{M} \leq \mathcal{N} \leq cl(\mathcal{M})$, then \mathcal{N} is a Fgag-CS in X .

Proof: Suppose that \mathcal{M} is a Fgag-CS in a FTS (X, τ) . Let \mathcal{U} be a Fag-OS in X such that $\mathcal{N} \leq \mathcal{U}$. Then $\mathcal{M} \leq \mathcal{U}$. Since \mathcal{M} is a Fgag-CS, it follows that $cl(\mathcal{M}) \leq \mathcal{U}$. Now, $\mathcal{N} \leq cl(\mathcal{M})$ implies $cl(\mathcal{N}) \leq cl(cl(\mathcal{M})) = cl(\mathcal{M})$. Thus, $cl(\mathcal{N}) \leq \mathcal{U}$. Hence \mathcal{N} is a Fgag-CS.

Theorem 3.21: If \mathcal{M} is a Fgag-OS in a FTS (X, τ) and $int(\mathcal{M}) \leq \mathcal{N} \leq \mathcal{M}$, then \mathcal{N} is a Fgag-OS in X .

Proof: Suppose that \mathcal{M} is a Fgag-OS in a FTS (X, τ) and $int(\mathcal{M}) \leq \mathcal{N} \leq \mathcal{M}$. Then $1_X - \mathcal{M}$ is a Fgag-CS and $1_X - \mathcal{M} \leq 1_X - \mathcal{N} \leq cl(1_X - \mathcal{M})$. Then $1_X - \mathcal{N}$ is a Fgag-CS by theorem (3.20). Hence, \mathcal{N} is a Fgag-OS.

Theorem 3.22: A F-set \mathcal{M} is Fgag-OS iff $\mathcal{C} \leq int(\mathcal{M})$ where \mathcal{C} is a Fgag-CS and $\mathcal{C} \leq \mathcal{M}$.

Proof: Suppose that $\mathcal{C} \leq int(\mathcal{M})$ where \mathcal{C} is a Fgag-CS and $\mathcal{C} \leq \mathcal{M}$. Then $1_X - \mathcal{M} \leq 1_X - \mathcal{C}$ and $1_X - \mathcal{C}$ is a Fag-OS by lemma (3.14). Now, $cl(1_X - \mathcal{M}) = 1_X - int(\mathcal{M}) \leq 1_X - \mathcal{C}$. Then $1_X - \mathcal{M}$ is a Fgag-CS. Hence \mathcal{M} is a Fgag-OS.

Conversely, let \mathcal{M} be a Fgag-OS and \mathcal{C} be a Fgag-CS and $\mathcal{C} \leq \mathcal{M}$. Then $1_X - \mathcal{M} \leq 1_X - \mathcal{C}$. Since $1_X - \mathcal{M}$ is a Fgag-CS and $1_X - \mathcal{C}$ is a Fag-OS, we have $cl(1_X - \mathcal{M}) \leq 1_X - \mathcal{C}$. Then $\mathcal{C} \leq int(\mathcal{M})$.

Definition 3.23: A F-set \mathcal{M} in a FTS (X, τ) is said to be a fuzzy gag-neighbourhood (briefly Fgag-nhd) of a fuzzy point x_λ if there exists a Fgag-OS \mathcal{N} such that $x_\lambda \in \mathcal{N} \leq \mathcal{M}$. A Fgag-nhd \mathcal{M} is said to be a Fgag-open-nhd (resp. Fgag-closed-nhd) iff \mathcal{M} is a Fgag-OS (resp. Fgag-CS). A F-set \mathcal{M} in a FTS (X, τ) is said to be a fuzzy gag- q -neighbourhood (briefly Fgag- q -nhd) of a fuzzy point x_λ (resp. F-set \mathcal{N}) if there exists a Fgag-OS \mathcal{A} in a FTS (X, τ) such that $x_\lambda q \mathcal{A} \leq \mathcal{M}$ (resp. $\mathcal{N} q \mathcal{A} \leq \mathcal{M}$).

Theorem 3.24: A F-set \mathcal{M} of a FTS (X, τ) is Fgag-CS iff $\mathcal{M} \bar{q} \mathcal{C} \Rightarrow cl(\mathcal{M}) \bar{q} \mathcal{C}$, for every Fag-CS \mathcal{C} of X .

Proof: Necessity. Let \mathcal{C} be a Fag-CS and $\mathcal{M} \bar{q} \mathcal{C}$. Then $\mathcal{M} \leq 1_X - \mathcal{C}$ and $1_X - \mathcal{C}$ is a Fag-OS in X which implies that $cl(\mathcal{M}) \leq 1_X - \mathcal{C}$ as \mathcal{M} is a Fgag-CS. Hence, $cl(\mathcal{M}) \bar{q} \mathcal{C}$.

Sufficiency. Let \mathcal{U} be a Fag-OS of a FTS (X, τ) such that $\mathcal{M} \leq \mathcal{U}$. Then $\mathcal{M} \bar{q} (1_X - \mathcal{U})$ and $1_X - \mathcal{U}$ is a Fag-CS in X . By hypothesis, $cl(\mathcal{M}) \bar{q} (1_X - \mathcal{U})$ implies $cl(\mathcal{M}) \leq \mathcal{U}$. Hence, \mathcal{M} is a Fgag-CS in X .

Theorem 3.25: Let x_λ and \mathcal{M} be a fuzzy point and a F-set respectively in a FTS (X, τ) . Then $x_\lambda \in gag-cl(\mathcal{M})$ iff every Fgag- q -nhd of x_λ is q -coincident with \mathcal{M} .

Proof: We prove by contradiction. Let $x_\lambda \in gag-cl(\mathcal{M})$. Suppose there exists a Fgag- q -nhd \mathcal{A} of x_λ such that $\mathcal{A} \bar{q} \mathcal{M}$. Since \mathcal{A} is a Fgag- q -nhd of x_λ , there exists a Fgag-OS \mathcal{B} in X such that $x_\lambda q \mathcal{B} \leq \mathcal{A}$ which gives that $\mathcal{B} \bar{q} \mathcal{M}$ and hence $\mathcal{M} \leq 1_X - \mathcal{B}$. Then $gag-cl(\mathcal{M}) \leq 1_X - \mathcal{B}$, as $1_X - \mathcal{B}$ is a Fgag-CS. Since $x_\lambda \notin 1_X - \mathcal{B}$, we have $x_\lambda \notin gag-cl(\mathcal{M})$, a contradiction. Thus every Fgag- q -nhd of x_λ is q -coincident with \mathcal{M} .

Conversely, suppose $x_\lambda \notin gag-cl(\mathcal{M})$. Then there exists a Fgag-CS \mathcal{N} such that $\mathcal{M} \leq \mathcal{N}$ and $x_\lambda \notin \mathcal{N}$. Then we have $x_\lambda q (1_X - \mathcal{N})$ and $\mathcal{M} \bar{q} (1_X - \mathcal{N})$, a contradiction. Hence $x_\lambda \in gag-cl(\mathcal{M})$.

Proposition 3.26: Let \mathcal{M} and \mathcal{N} be two F-sets in a FTS (X, τ) . Then the following properties hold:

- (i) $gag-cl(0_X) = 0_X$, $gag-cl(1_X) = 1_X$.
- (ii) $gag-cl(\mathcal{M})$ is a Fgag-CS in X .
- (iii) $gag-cl(\mathcal{M}) \leq gag-cl(\mathcal{N})$ when $\mathcal{M} \leq \mathcal{N}$.
- (iv) $\mathcal{A} q \mathcal{M}$ iff $\mathcal{A} q gag-cl(\mathcal{M})$, when \mathcal{A} is a Fgag-OS in X .
- (v) $gag-cl(\mathcal{M}) = gag-cl(gag-cl(\mathcal{M}))$.
- (vi) $gag-cl(\mathcal{M} \wedge \mathcal{N}) \leq gag-cl(\mathcal{M}) \wedge gag-cl(\mathcal{N})$.
- (vii) $gag-cl(\mathcal{M} \vee \mathcal{N}) = gag-cl(\mathcal{M}) \vee gag-cl(\mathcal{N})$.

Proof: (i) and (ii) are obvious.

(iii) Suppose that $x_\lambda \notin gag-cl(\mathcal{N})$. By theorem (3.25), there is a Fgag- q -nhd \mathcal{B} of a fuzzy point x_λ such that $\mathcal{B} \bar{q} \mathcal{N}$, so there is a Fgag-OS \mathcal{A} such that $x_\lambda q \mathcal{A} \leq \mathcal{B}$ and $\mathcal{A} \bar{q} \mathcal{N}$. Since $\mathcal{M} \leq \mathcal{N}$, then $\mathcal{A} \bar{q} \mathcal{M}$. Hence $x_\lambda \notin gag-cl(\mathcal{M})$ by theorem (3.25). This shows that $gag-cl(\mathcal{M}) \leq gag-cl(\mathcal{N})$.

(iv) Let \mathcal{A} be a Fgag-OS in X . Suppose that $\mathcal{A} \bar{q} \mathcal{M}$, then $\mathcal{M} \leq 1_X - \mathcal{A}$. Since $1_X - \mathcal{A}$ is a Fgag-CS and by a part (iii), $gag-cl(\mathcal{M}) \leq gag-cl(1_X - \mathcal{A}) = 1_X - \mathcal{A}$. Hence, $\mathcal{A} \bar{q} gag-cl(\mathcal{M})$.

Conversely, suppose that $\mathcal{A}\bar{q}gag-cl(\mathcal{M})$. Then $gag-cl(\mathcal{M}) \leq 1_X - \mathcal{A}$. Since $\mathcal{M} \leq gag-cl(\mathcal{M})$, we have $\mathcal{M} \leq 1_X - \mathcal{A}$. Hence $\mathcal{A}\bar{q}\mathcal{M}$. Thus $\mathcal{A}q\mathcal{M}$ if and only if $\mathcal{A}qgag-cl(\mathcal{M})$.

(v) Since $gag-cl(\mathcal{M}) \leq gag-cl(gag-cl(\mathcal{M}))$. We prove that $gag-cl(gag-cl(\mathcal{M})) \leq gag-cl(\mathcal{M})$. Suppose that $x_\lambda \notin gag-cl(\mathcal{M})$. Then by theorem (3.25), there exists a Fgag- q -nhd \mathcal{B} of a fuzzy point x_λ such that $\mathcal{B}\bar{q}\mathcal{M}$ and so there is a Fgag-OS \mathcal{A} in X such that $x_\lambda q\mathcal{A} \leq \mathcal{B}$ and $\mathcal{A}\bar{q}\mathcal{M}$. By a part (iv), $\mathcal{A}\bar{q}gag-cl(\mathcal{M})$. Then by theorem (3.25), $x_\lambda \notin gag-cl(gag-cl(\mathcal{M}))$. Thus $gag-cl(gag-cl(\mathcal{M})) \leq gag-cl(\mathcal{M})$. Hence $gag-cl(\mathcal{M}) = gag-cl(gag-cl(\mathcal{M}))$.

(vi) Since $\mathcal{M} \wedge \mathcal{N} \leq \mathcal{M}$ and $\mathcal{M} \wedge \mathcal{N} \leq \mathcal{N}$. Then $gag-cl(\mathcal{M} \wedge \mathcal{N}) \leq gag-cl(\mathcal{M})$ and $gag-cl(\mathcal{M} \wedge \mathcal{N}) \leq gag-cl(\mathcal{N})$ by a part (iii). Hence, $gag-cl(\mathcal{M} \wedge \mathcal{N}) \leq gag-cl(\mathcal{M}) \wedge gag-cl(\mathcal{N})$.

(vii) Since $\mathcal{M} \leq \mathcal{M} \vee \mathcal{N}$ and $\mathcal{N} \leq \mathcal{M} \vee \mathcal{N}$. By a part (iii), we have $gag-cl(\mathcal{M}) \leq gag-cl(\mathcal{M} \vee \mathcal{N})$ and $gag-cl(\mathcal{N}) \leq gag-cl(\mathcal{M} \vee \mathcal{N})$. Then $gag-cl(\mathcal{M}) \vee gag-cl(\mathcal{N}) \leq gag-cl(\mathcal{M} \vee \mathcal{N})$.

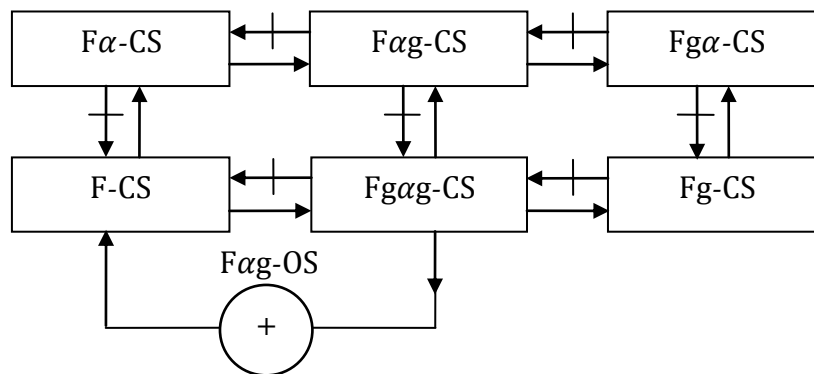

Conversely, let $x_\lambda \in gag-cl(\mathcal{M} \vee \mathcal{N})$. Then by theorem (3.25), there exists a Fgag- q -nhd \mathcal{A} of a fuzzy point x_λ such that $\mathcal{A}q(\mathcal{M} \vee \mathcal{N})$. By proposition (2.2), either $\mathcal{A}q\mathcal{M}$ or $\mathcal{A}q\mathcal{N}$. Then by theorem (3.25), $x_\lambda \in gag-cl(\mathcal{M})$ or $x_\lambda \in gag-cl(\mathcal{N})$. That is $x_\lambda \in gag-cl(\mathcal{M}) \vee gag-cl(\mathcal{N})$. Then $gag-cl(\mathcal{M} \vee \mathcal{N}) \leq gag-cl(\mathcal{M}) \vee gag-cl(\mathcal{N})$. Hence, $gag-cl(\mathcal{M} \vee \mathcal{N}) = gag-cl(\mathcal{M}) \vee gag-cl(\mathcal{N})$.

Proposition 3.27: Let \mathcal{M} and \mathcal{N} be two F-sets in a FTS (X, τ) . Then the following properties hold:

- (i) $gag-int(0_X) = 0_X, gag-int(1_X) = 1_X$.
- (ii) $gag-int(\mathcal{M})$ is a Fgag-OS in X .
- (iii) $gag-int(\mathcal{M}) \leq gag-int(\mathcal{N})$ when $\mathcal{M} \leq \mathcal{N}$.
- (iv) $gag-int(\mathcal{M}) = gag-int(gag-int(\mathcal{M}))$.
- (v) $gag-int(\mathcal{M} \wedge \mathcal{N}) = gag-int(\mathcal{M}) \wedge gag-int(\mathcal{N})$.
- (vi) $gag-int(\mathcal{M} \vee \mathcal{N}) \geq gag-int(\mathcal{M}) \vee gag-int(\mathcal{N})$.

Proof: Obvious.

Remark 3.28: The following diagram shows the relations among the different types of weakly F-CS that were studied in this section:

4. Fuzzy $g\alpha g$ -Continuous Functions

Definition 4.1: A function $f: (X, \tau) \rightarrow (Y, \psi)$ is said to be a fuzzy $g\alpha g$ -continuous (briefly Fg αg -continuous) if $f^{-1}(\mathcal{V})$ is a Fg αg -CS in X for every F-CS \mathcal{V} in Y .

Proposition 4.2: Let (X, τ) and (Y, ψ) be FTS, and $f: (X, \tau) \rightarrow (Y, \psi)$ be a function. Then f is a Fg αg -continuous function iff $f^{-1}(\mathcal{V})$ is a Fg αg -OS in X , for every F-OS \mathcal{V} in Y .

Proof: Let \mathcal{V} be a F-OS in Y . Then $1_Y - \mathcal{V}$ is a F-CS in Y , so $f^{-1}(1_Y - \mathcal{V}) = 1_X - f^{-1}(\mathcal{V})$ is a Fg αg -CS in X . Thus, $f^{-1}(\mathcal{V})$ is a Fg αg -OS in X . The proof of the converse is obvious.

Theorem 4.3: Every Fg α g-continuous function is a F α g-continuous.

Proof: Let $f: (X, \tau) \rightarrow (Y, \psi)$ be a Fg α g-continuous function and let \mathcal{V} be a F-CS in Y . Since f is a Fg α g-continuous, $f^{-1}(\mathcal{V})$ is a Fg α g-CS in X . By theorem (3.4) part (iii), $f^{-1}(\mathcal{V})$ is a F α g-CS in X . Thus, f is a F α g-continuous.

Theorem 4.4: Every Fg α g-continuous function is a Fg α -continuous.

Proof: Let $f: (X, \tau) \rightarrow (Y, \psi)$ be a Fg α g-continuous function and let \mathcal{V} be a F-CS in Y . Since f is a Fg α g-continuous, $f^{-1}(\mathcal{V})$ is a Fg α g-CS in X . By theorem (3.4) part (iv), $f^{-1}(\mathcal{V})$ is a Fg α -CS in X . Thus, f is a Fg α -continuous.

The converse of the above theorems need not be true as shown in the following example.

Example 4.5: Let $X = \{x, y\}, Y = \{u, v\}$. F-set \mathcal{M} is defined as: $\mathcal{M}(x) = 0.4, \mathcal{M}(y) = 0.6$. Let $\tau = \{0_X, \mathcal{M}, 1_X\}$ and $\psi = \{0_Y, 1_Y\}$ be FTS. Then the function $f: (X, \tau) \rightarrow (Y, \psi)$ defined by $f(x) = u, f(y) = v$ is a F α g-continuous and hence Fg α -continuous but not Fg α g-continuous.

Theorem 4.6: If $f: (X, \tau) \rightarrow (Y, \psi)$ is a Fg α g-continuous function then for each fuzzy point x_λ of X and $\mathcal{N} \in \psi$ such that $f(x_\lambda) \in \mathcal{N}$, there exists a Fg α g-OS \mathcal{M} of X such that $x_\lambda \in \mathcal{M}$ and $f(\mathcal{M}) \leq \mathcal{N}$.

Proof: Let x_λ be a fuzzy point of X and $\mathcal{N} \in \psi$ such that $f(x_\lambda) \in \mathcal{N}$. Take $\mathcal{M} = f^{-1}(\mathcal{N})$. Since $1_Y - \mathcal{N}$ is a F-CS in Y and f is a Fg α g-continuous function, we have $f^{-1}(1_Y - \mathcal{N}) = 1_X - f^{-1}(\mathcal{N})$ is a Fg α g-CS in X . This gives $\mathcal{M} = f^{-1}(\mathcal{N})$ is a Fg α g-OS in X and $x_\lambda \in \mathcal{M}$ and $f(\mathcal{M}) = f(f^{-1}(\mathcal{N})) \leq \mathcal{N}$.

Theorem 4.7: If $f: (X, \tau) \rightarrow (Y, \psi)$ is a Fg α g-continuous function then for each fuzzy point x_λ of X and $\mathcal{N} \in \psi$ such that $f(x_\lambda) q \mathcal{N}$, there exists a Fg α g-OS \mathcal{M} of X such that $x_\lambda q \mathcal{M}$ and $f(\mathcal{M}) \leq \mathcal{N}$.

Proof: Let x_λ be a fuzzy point of X and $\mathcal{N} \in \psi$ such that $f(x_\lambda) q \mathcal{N}$. Take $\mathcal{M} = f^{-1}(\mathcal{N})$. By above theorem (4.6), \mathcal{M} is a Fg α g-OS in X and $x_\lambda q \mathcal{M}$ and $f(\mathcal{M}) = f(f^{-1}(\mathcal{N})) \leq \mathcal{N}$.

Definition 4.8: A function $f: (X, \tau) \rightarrow (Y, \psi)$ is said to be a fuzzy g α g-irresolute (briefly Fg α g-irresolute) if $f^{-1}(\mathcal{V})$ is a Fg α g-CS in X for every Fg α g-CS \mathcal{V} in Y .

Proposition 4.9: Let (X, τ) and (Y, ψ) be FTS, and $f: (X, \tau) \rightarrow (Y, \psi)$ be a function. Then f is a Fg α g-irresolute function iff $f^{-1}(\mathcal{V})$ is a Fg α g-OS in X , for every Fg α g-OS \mathcal{V} in Y .

Proof: Let \mathcal{V} be a Fg α g-OS in Y . Then $1_Y - \mathcal{V}$ is a Fg α g-CS in Y , so $f^{-1}(1_Y - \mathcal{V}) = 1_X - f^{-1}(\mathcal{V})$ is a Fg α g-CS in X . Thus, $f^{-1}(\mathcal{V})$ is a Fg α g-OS in X . The proof of the converse is obvious.

Theorem 4.10: Every Fg α g-irresolute function is a Fg α g-continuous.

Proof: Let $f: (X, \tau) \rightarrow (Y, \psi)$ be a Fg α g-irresolute function and let \mathcal{V} be a F-CS in Y , by theorem (3.4) part (i), then \mathcal{V} is a Fg α g-CS in Y . Since f is a Fg α g-irresolute, then $f^{-1}(\mathcal{V})$ is a Fg α g-CS in X . Thus, f is a Fg α g-continuous.

The following example shows that the converse of the above theorem not be true.

Example 4.11: Let $X = \{x, y, z\}, Y = \{u, v, w\}$. F-sets \mathcal{M} and \mathcal{N} are defined as follows: $\mathcal{M}(x) = 0.7, \mathcal{M}(y) = 0.2, \mathcal{M}(z) = 0.1; \mathcal{N}(u) = 0.1, \mathcal{N}(v) = 0.7, \mathcal{N}(w) = 0.2$. Let $\tau = \{0_X, \mathcal{M}, 1_X\}$ and $\psi = \{0_Y, \mathcal{N}, 1_Y\}$ be FTS. Then the function $f: (X, \tau) \rightarrow (Y, \psi)$ defined by $f(x) = v, f(y) = w, f(z) = u$ is a Fg α g-continuous and it is not a Fg α g-irresolute.

Definition 4.12: A FTS (X, τ) is said to be a fuzzy $T_{g\alpha g}$ -space (briefly $FT_{g\alpha g}$ -space) if every $Fg\alpha g$ -CS in it is a F-CS.

Proposition 4.13: Every $FT_{\frac{1}{2}}$ -space is a $FT_{g\alpha g}$ -space.

Proof: Let (X, τ) be a $FT_{\frac{1}{2}}$ -space and let \mathcal{M} be a $Fg\alpha g$ -CS in X . Then \mathcal{M} is a Fg-CS, by theorem (3.4) part (ii). Since (X, τ) is a $FT_{\frac{1}{2}}$ -space, then \mathcal{M} is a F-CS in X . Hence (X, τ) is a $FT_{g\alpha g}$ -space.

The following example shows that the converse of the above proposition not be true.

Example 4.14: Let $X = \{x, y, z\}$ and the F-sets \mathcal{M} and \mathcal{N} from X to $[0,1]$ be defined as: $\mathcal{M}(x) = 0.7, \mathcal{M}(y) = 0.3, \mathcal{M}(z) = 1.0; \mathcal{N}(x) = 0.7, \mathcal{N}(y) = 0.0, \mathcal{N}(z) = 0.0$. Let $\tau = \{0_X, \mathcal{M}, \mathcal{N}, 1_X\}$ be a FTS. Then (X, τ) is a $FT_{g\alpha g}$ -space but not $FT_{\frac{1}{2}}$ -space.

Theorem 4.15: If $f_1: (X, \tau) \rightarrow (Y, \psi)$ is a $Fg\alpha g$ -continuous function and $f_2: (Y, \psi) \rightarrow (Z, \rho)$ is a Fg-continuous function and (Y, ψ) is a $FT_{\frac{1}{2}}$ -space. Then $f_2 \circ f_1: (X, \tau) \rightarrow (Z, \rho)$ is a $Fg\alpha g$ -continuous function.

Proof: Let \mathcal{W} be a F-CS in Z . Since f_2 is a Fg-continuous function and (Y, ψ) is a $FT_{\frac{1}{2}}$ -space, $f_2^{-1}(\mathcal{W})$ is a F-CS in Y . Since f_1 is a $Fg\alpha g$ -continuous function, $f_1^{-1}(f_2^{-1}(\mathcal{W}))$ is a $Fg\alpha g$ -CS in X . Thus, $f_2 \circ f_1$ is a $Fg\alpha g$ -continuous.

Theorem 4.16: Let (X, τ) and (Y, ψ) be FTS, and $f: (X, \tau) \rightarrow (Y, \psi)$ be a function:

- (i) If (X, τ) is a $FT_{\frac{1}{2}}$ -space then f is a Fg-continuous iff it is a $Fg\alpha g$ -continuous.
- (ii) If (X, τ) is a $FT_{g\alpha g}$ -space then f is a F-continuous iff it is a $Fg\alpha g$ -continuous.

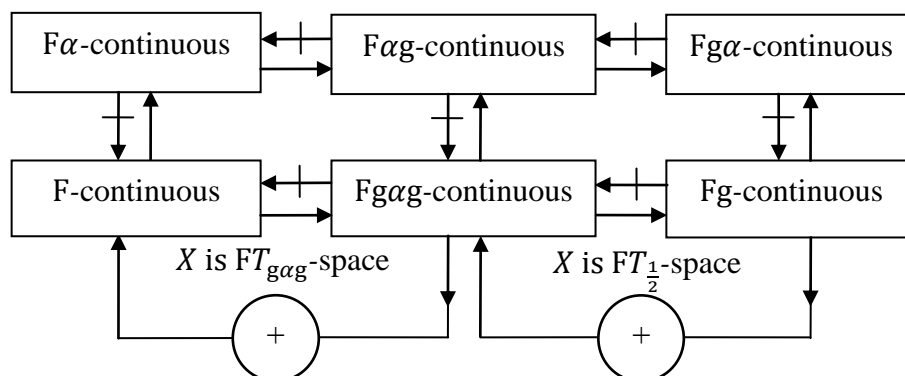

Proof: (i) Let \mathcal{V} be any F-CS in Y . Since f is a Fg-continuous, $f^{-1}(\mathcal{V})$ is a Fg-CS in X . By (X, τ) is a $FT_{\frac{1}{2}}$ -space, which implies, $f^{-1}(\mathcal{V})$ is a F-CS. By theorem (3.4) part (i), $f^{-1}(\mathcal{V})$ is a $Fg\alpha g$ -CS in X . Hence f is a $Fg\alpha g$ -continuous.

Conversely, suppose that f is a $Fg\alpha g$ -continuous. Let \mathcal{V} be any F-CS in Y . Then $f^{-1}(\mathcal{V})$ is a $Fg\alpha g$ -CS in X . By theorem (3.4) part (ii), $f^{-1}(\mathcal{V})$ is a Fg-CS in X . Hence f is a Fg-continuous.

(ii) Let \mathcal{V} be any F-CS in Y . Since f is a F-continuous, $f^{-1}(\mathcal{V})$ is a F-CS in X . By theorem (3.4) part (i), $f^{-1}(\mathcal{V})$ is a $Fg\alpha g$ -CS in X . Hence f is a $Fg\alpha g$ -continuous.

Conversely, suppose that f is a $Fg\alpha g$ -continuous. Let \mathcal{V} be any F-CS in Y . Then $f^{-1}(\mathcal{V})$ is a $Fg\alpha g$ -CS in X . By (X, τ) is a $FT_{g\alpha g}$ -space, which implies $f^{-1}(\mathcal{V})$ is a F-CS in X . Hence f is a F-continuous.

Remark 4.17: The following diagram shows the relations among the different types of weakly F-continuous functions that were studied in this section:

5. Fuzzy $g\alpha g$ - R_i -Spaces, $i = 0, 1$

Definition 5.1: The intersection of all Fgag-open subset of a FTS (X, τ) containing \mathcal{A} is called the fuzzy $g\alpha g$ -kernel of \mathcal{A} (briefly $g\alpha g$ -ker(\mathcal{A})), this means $g\alpha g$ -ker(\mathcal{A}) = $\bigwedge \{ \mathcal{M} : \mathcal{M} \in \text{Fgag-O}(X) \text{ and } \mathcal{A} \leq \mathcal{M} \}$.

Definition 5.2: Let x_λ be a fuzzy point of a FTS (X, τ) . The fuzzy $g\alpha g$ -kernel of x_λ , denoted by $g\alpha g$ -ker($\{x_\lambda\}$) is defined to be the F-set $g\alpha g$ -ker($\{x_\lambda\}$) = $\bigwedge \{ \mathcal{M} : \mathcal{M} \in \text{Fgag-O}(X) \text{ and } x_\lambda \in \mathcal{M} \}$.

Definition 5.3: In a FTS (X, τ) , a F-set \mathcal{A} is said to be weakly ultra fuzzy $g\alpha g$ -separated from \mathcal{B} if there exists a Fgag-OS \mathcal{M} such that $\mathcal{M} \wedge \mathcal{B} = 0_X$ or $\mathcal{A} \wedge g\alpha g$ -cl(\mathcal{B}) = 0_X .

By definition (5.3), we have the following: For every two distinct fuzzy points x_λ and y_μ of a FTS (X, τ) ,

- (i) $g\alpha g$ -cl($\{x_\lambda\}$) = $\{y_\mu : \{y_\mu\}$ is not weakly ultra fuzzy $g\alpha g$ -separated from $\{x_\lambda\}\}$.
- (ii) $g\alpha g$ -ker($\{x_\lambda\}$) = $\{y_\mu : \{x_\lambda\}$ is not weakly ultra fuzzy $g\alpha g$ -separated from $\{y_\mu\}\}$.

Lemma 5.4: Let (X, τ) be a FTS, then $y_\mu \in g\alpha g$ -ker($\{x_\lambda\}$) iff $x_\lambda \in g\alpha g$ -cl($\{y_\mu\}$) for each $x \neq y \in X$.

Proof: Suppose that $y_\mu \notin g\alpha g$ -ker($\{x_\lambda\}$). Then there exists a Fgag-OS \mathcal{U} containing x_λ such that $y_\mu \notin \mathcal{U}$. Therefore, we have $x_\lambda \notin g\alpha g$ -cl($\{y_\mu\}$). The converse part can be proved in a similar way.

Definition 5.5: A FTS (X, τ) is said to be fuzzy $g\alpha g$ - R_0 -space (Fgag- R_0 -space, for short) if for each Fgag-OS \mathcal{U} and $x_\lambda \in \mathcal{U}$, then $g\alpha g$ -cl($\{x_\lambda\}$) $\leq \mathcal{U}$.

Definition 5.6: A FTS (X, τ) is said to be fuzzy $g\alpha g$ - R_1 -space (Fgag- R_1 -space, for short) if for each two distinct fuzzy points x_λ and y_μ of X with $g\alpha g$ -cl($\{x_\lambda\}$) $\neq g\alpha g$ -cl($\{y_\mu\}$), there exist disjoint Fgag-OS \mathcal{U}, \mathcal{V} such that $g\alpha g$ -cl($\{x_\lambda\}$) $\leq \mathcal{U}$ and $g\alpha g$ -cl($\{y_\mu\}$) $\leq \mathcal{V}$.

Theorem 5.7: Let (X, τ) be a FTS. Then (X, τ) is a Fgag- R_0 -space iff $g\alpha g$ -cl($\{x_\lambda\}$) = $g\alpha g$ -ker($\{x_\lambda\}$), for each $x \in X$.

Proof: Let (X, τ) be a Fgag- R_0 -space. If $g\alpha g$ -cl($\{x_\lambda\}$) $\neq g\alpha g$ -ker($\{x_\lambda\}$), for each $x \in X$, then there exist another fuzzy point $y \neq x$ such that $y_\mu \in g\alpha g$ -cl($\{x_\lambda\}$) and $y_\mu \notin g\alpha g$ -ker($\{x_\lambda\}$) this means there exist an \mathcal{U}_{x_λ} Fgag-OS, $y_\mu \notin \mathcal{U}_{x_\lambda}$ implies $g\alpha g$ -cl($\{x_\lambda\}$) $\not\leq \mathcal{U}_{x_\lambda}$ this contradiction. Thus $g\alpha g$ -cl($\{x_\lambda\}$) = $g\alpha g$ -ker($\{x_\lambda\}$).

Conversely, let $g\alpha g$ -cl($\{x_\lambda\}$) = $g\alpha g$ -ker($\{x_\lambda\}$), for each Fgag-OS $\mathcal{U}, x_\lambda \in \mathcal{U}$, then $g\alpha g$ -ker($\{x_\lambda\}$) = $g\alpha g$ -cl($\{x_\lambda\}$) $\leq \mathcal{U}$ [by definition (5.1)]. Hence by definition (5.5), (X, τ) is a Fgag- R_0 -space.

Theorem 5.8: A FTS (X, τ) is an Fgag- R_0 -space iff for each \mathcal{M} Fgag-CS and $x_\lambda \in \mathcal{M}$, then $g\alpha g$ -ker($\{x_\lambda\}$) $\leq \mathcal{M}$.

Proof: Let for each \mathcal{M} Fgag-CS and $x_\lambda \in \mathcal{M}$, then $g\alpha g$ -ker($\{x_\lambda\}$) $\leq \mathcal{M}$ and let \mathcal{U} be a Fgag-OS, $x_\lambda \in \mathcal{U}$ then for each $y_\mu \notin \mathcal{U}$ implies $y_\mu \in \mathcal{U}^c$ is a Fgag-CS implies $g\alpha g$ -ker($\{y_\mu\}$) $\leq \mathcal{U}^c$ [by assumption]. Therefore $x_\lambda \notin g\alpha g$ -ker($\{y_\mu\}$) implies $y_\mu \notin g\alpha g$ -cl($\{x_\lambda\}$) [by lemma (5.4)]. So $g\alpha g$ -cl($\{x_\lambda\}$) $\leq \mathcal{U}$. Thus (X, τ) is a Fgag- R_0 -space.

Conversely, let (X, τ) be a Fgag- R_0 -space and \mathcal{M} be a Fgag-CS and $x_\lambda \in \mathcal{M}$. Then for each $y_\mu \notin \mathcal{M}$ implies $y_\mu \in \mathcal{M}^c$ is a Fgag-OS, then $g\alpha g$ -cl($\{y_\mu\}$) $\leq \mathcal{M}^c$ [since (X, τ) is a Fgag- R_0 -space], so $g\alpha g$ -ker($\{x_\lambda\}$) = $g\alpha g$ -cl($\{x_\lambda\}$). Thus $g\alpha g$ -ker($\{x_\lambda\}$) $\leq \mathcal{M}$.

Corollary 5.9: A FTS (X, τ) is Fgag- R_0 -space iff for each \mathcal{U} Fgag-OS and $x_\lambda \in \mathcal{U}$, then $\text{gag-cl}(\text{gag-ker}(\{x_\lambda\})) \leq \mathcal{U}$.

Proof: Clearly.

Theorem 5.10: Every Fgag- R_1 -space is a Fgag- R_0 -space.

Proof: Let (X, τ) be a Fgag- R_1 -space and let \mathcal{U} be a Fgag-OS, $x_\lambda \in \mathcal{U}$, then for each $y_\mu \notin \mathcal{U}$ implies $y_\mu \in \mathcal{U}^c$ is a Fgag-CS and $\text{gag-cl}(\{y_\mu\}) \leq \mathcal{U}^c$ implies $\text{gag-cl}(\{x_\lambda\}) \neq \text{gag-cl}(\{y_\mu\})$. Hence by definition (5.6), $\text{gag-cl}(\{x_\lambda\}) \leq \mathcal{U}$. Thus (X, τ) is a Fgag- R_0 -space.

Theorem 5.11: A FTS (X, τ) is Fgag- R_1 -space iff for each $x \neq y \in X$ with $\text{gag-ker}(\{x_\lambda\}) \neq \text{gag-ker}(\{y_\mu\})$, then there exist Fgag-CS $\mathcal{M}_1, \mathcal{M}_2$ such that $\text{gag-ker}(\{x_\lambda\}) \leq \mathcal{M}_1$, $\text{gag-ker}(\{x_\lambda\}) \wedge \mathcal{M}_2 = 0_X$ and $\text{gag-ker}(\{y_\mu\}) \leq \mathcal{M}_2$, $\text{gag-ker}(\{y_\mu\}) \wedge \mathcal{M}_1 = 0_X$ and $\mathcal{M}_1 \vee \mathcal{M}_2 = 1_X$.

Proof: Let (X, τ) be a Fgag- R_1 -space. Then for each $x \neq y \in X$ with $\text{gag-ker}(\{x_\lambda\}) \neq \text{gag-ker}(\{y_\mu\})$. Since every Fgag- R_1 -space is a Fgag- R_0 -space [by theorem (5.10)], and by theorem (5.7), $\text{gag-cl}(\{x_\lambda\}) \neq \text{gag-cl}(\{y_\mu\})$, then there exist Fgag-OS $\mathcal{U}_1, \mathcal{U}_2$ such that $\text{gag-cl}(\{x_\lambda\}) \leq \mathcal{U}_1$ and $\text{gag-cl}(\{y_\mu\}) \leq \mathcal{U}_2$ and $\mathcal{U}_1 \wedge \mathcal{U}_2 = 0_X$ [since (X, τ) is a Fgag- R_1 -space], then \mathcal{U}_1^c and \mathcal{U}_2^c are Fgag-CS such that $\mathcal{U}_1^c \vee \mathcal{U}_2^c = 1_X$. Put $\mathcal{M}_1 = \mathcal{U}_1^c$ and $\mathcal{M}_2 = \mathcal{U}_2^c$. Thus $x_\lambda \in \mathcal{U}_1 \leq \mathcal{M}_2$ and $y_\mu \in \mathcal{U}_2 \leq \mathcal{M}_1$ so that $\text{gag-ker}(\{x_\lambda\}) \leq \mathcal{U}_1 \leq \mathcal{M}_2$ and $\text{gag-ker}(\{y_\mu\}) \leq \mathcal{U}_2 \leq \mathcal{M}_1$.

Conversely, let for each $x \neq y \in X$ with $\text{gag-ker}(\{x_\lambda\}) \neq \text{gag-ker}(\{y_\mu\})$, there exist Fgag-CS $\mathcal{M}_1, \mathcal{M}_2$ such that $\text{gag-ker}(\{x_\lambda\}) \leq \mathcal{M}_1$, $\text{gag-ker}(\{x_\lambda\}) \wedge \mathcal{M}_2 = 0_X$ and $\text{gag-ker}(\{y_\mu\}) \leq \mathcal{M}_2$, $\text{gag-ker}(\{y_\mu\}) \wedge \mathcal{M}_1 = 0_X$ and $\mathcal{M}_1 \vee \mathcal{M}_2 = 1_X$, then \mathcal{M}_1^c and \mathcal{M}_2^c are Fgag-OS such that $\mathcal{M}_1^c \wedge \mathcal{M}_2^c = 0_X$. Put $\mathcal{M}_1^c = \mathcal{U}_1$ and $\mathcal{M}_2^c = \mathcal{U}_2$. Thus, $\text{gag-ker}(\{x_\lambda\}) \leq \mathcal{U}_1$ and $\text{gag-ker}(\{y_\mu\}) \leq \mathcal{U}_2$ and $\mathcal{U}_1 \wedge \mathcal{U}_2 = 0_X$, so that $x_\lambda \in \mathcal{U}_1$ and $y_\mu \in \mathcal{U}_2$ implies $x_\lambda \notin \text{gag-cl}(\{y_\mu\})$ and $y_\mu \notin \text{gag-cl}(\{x_\lambda\})$, then $\text{gag-cl}(\{x_\lambda\}) \leq \mathcal{U}_1$ and $\text{gag-cl}(\{y_\mu\}) \leq \mathcal{U}_2$. Thus, (X, τ) is a Fgag- R_1 -space.

Corollary 5.12: A FTS (X, τ) is Fgag- R_1 -space iff for each $x \neq y \in X$ with $\text{gag-cl}(\{x_\lambda\}) \neq \text{gag-cl}(\{y_\mu\})$ there exist disjoint Fgag-OS \mathcal{U}, \mathcal{V} such that $\text{gag-cl}(\text{gag-ker}(\{x_\lambda\})) \leq \mathcal{U}$ and $\text{gag-cl}(\text{gag-ker}(\{y_\mu\})) \leq \mathcal{V}$.

Proof: Let (X, τ) be a Fgag- R_1 -space and let $x \neq y \in X$ with $\text{gag-cl}(\{x_\lambda\}) \neq \text{gag-cl}(\{y_\mu\})$, then there exist disjoint Fgag-OS \mathcal{U}, \mathcal{V} such that $\text{gag-cl}(\{x_\lambda\}) \leq \mathcal{U}$ and $\text{gag-cl}(\{y_\mu\}) \leq \mathcal{V}$. Also (X, τ) is a Fgag- R_0 -space [by theorem (5.10)] implies for each $x \in X$, then $\text{gag-cl}(\{x_\lambda\}) = \text{gag-ker}(\{x_\lambda\})$ [by theorem (5.7)], but $\text{gag-cl}(\{x_\lambda\}) = \text{gag-cl}(\text{gag-cl}(\{x_\lambda\})) = \text{gag-cl}(\text{gag-ker}(\{x_\lambda\}))$. Thus $\text{gag-cl}(\text{gag-ker}(\{x_\lambda\})) \leq \mathcal{U}$ and $\text{gag-cl}(\text{gag-ker}(\{y_\mu\})) \leq \mathcal{V}$.

Conversely, let for each $x \neq y \in X$ with $\text{gag-cl}(\{x_\lambda\}) \neq \text{gag-cl}(\{y_\mu\})$ there exist disjoint Fgag-OS \mathcal{U}, \mathcal{V} such that $\text{gag-cl}(\text{gag-ker}(\{x_\lambda\})) \leq \mathcal{U}$ and $\text{gag-cl}(\text{gag-ker}(\{y_\mu\})) \leq \mathcal{V}$. Since $\{x_\lambda\} \leq \text{gag-ker}(\{x_\lambda\})$, then $\text{gag-cl}(\{x_\lambda\}) \leq \text{gag-cl}(\text{gag-ker}(\{x_\lambda\}))$ for each $x \in X$. So we get $\text{gag-cl}(\{x_\lambda\}) \leq \mathcal{U}$ and $\text{gag-cl}(\{y_\mu\}) \leq \mathcal{V}$. Thus, (X, τ) is a Fgag- R_1 -space.

6. Fuzzy gag- T_j -Spaces, $j = 0, 1, 2$

Definition 6.1: Let (X, τ) be a FTS. Then X is said to be:

- (i) fuzzy gag- T_0 -space (Fgag- T_0 -space, for short) iff for each pair of distinct fuzzy points in X , there exists a Fgag-OS in X containing one and not the other.
- (ii) fuzzy gag- T_1 -space (Fgag- T_1 -space, for short) iff for each pair of distinct fuzzy points x_λ and y_μ of X , there exist Fgag-OS \mathcal{M}, \mathcal{N} containing x_λ and y_μ respectively such that $y_\mu \notin \mathcal{M}$ and $x_\lambda \notin \mathcal{N}$.
- (iii) fuzzy gag- T_2 -space (Fgag- T_2 -space, for short) iff for each pair of distinct fuzzy points x_λ and y_μ of X , there exist disjoint Fgag-OS \mathcal{M}, \mathcal{N} in X such that $x_\lambda \in \mathcal{M}$ and $y_\mu \in \mathcal{N}$.

Example 6.2: Let $X = \{x, y\}$ and $\tau = \{0_X, x_1, 1_X\}$ be a FTS on X . Then x_1 is a crisp point in X and (X, τ) is a Fgag- T_0 -space.

Example 6.3: Let $X = \{a, b\}$ and $\tau = \{0_X, a_1, b_1, 1_X\}$ be a FTS on X . Then a_1, b_1 are crisp points in X and (X, τ) is a Fgag- T_1 -space and Fgag- T_2 -space.

Remark 6.4: Every Fgag- T_k -space is a Fgag- T_{k-1} -space, $k = 1, 2$.

Proof: Clearly.

Theorem 6.5: A FTS (X, τ) is Fgag- T_0 -space iff either $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$ or $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$, for each $x \neq y \in X$.

Proof: Let (X, τ) be a Fgag- T_0 -space then for each $x \neq y \in X$, there exists a Fgag-OS \mathcal{M} such that $x_\lambda \in \mathcal{M}, y_\mu \notin \mathcal{M}$ or $x_\lambda \notin \mathcal{M}, y_\mu \in \mathcal{M}$. Thus either $x_\lambda \in \mathcal{M}, y_\mu \notin \mathcal{M}$ implies $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$ or $x_\lambda \notin \mathcal{M}, y_\mu \in \mathcal{M}$ implies $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$.

Conversely, let either $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$ or $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$, for each $x \neq y \in X$. Then there exists a Fgag-OS \mathcal{M} such that $x_\lambda \in \mathcal{M}, y_\mu \notin \mathcal{M}$ or $x_\lambda \notin \mathcal{M}, y_\mu \in \mathcal{M}$. Thus (X, τ) is a Fgag- T_0 -space.

Theorem 6.6: A FTS (X, τ) is Fgag- T_0 -space iff either $\text{gag-ker}(\{x_\lambda\})$ is weakly ultra fuzzy gag-separated from $\{y_\mu\}$ or $\text{gag-ker}(\{y_\mu\})$ is weakly ultra fuzzy gag-separated from $\{x_\lambda\}$ for each $x \neq y \in X$.

Proof: Let (X, τ) be a Fgag- T_0 -space then for each $x \neq y \in X$, there exists a Fgag-OS \mathcal{M} such that $x_\lambda \in \mathcal{M}, y_\mu \notin \mathcal{M}$ or $x_\lambda \notin \mathcal{M}, y_\mu \in \mathcal{M}$. Now if $x_\lambda \in \mathcal{M}, y_\mu \notin \mathcal{M}$ implies $\text{gag-ker}(\{x_\lambda\})$ is weakly ultra fuzzy gag-separated from $\{y_\mu\}$. Or if $x_\lambda \notin \mathcal{M}, y_\mu \in \mathcal{M}$ implies $\text{gag-ker}(\{y_\mu\})$ is weakly ultra fuzzy gag-separated from $\{x_\lambda\}$.

Conversely, let either $\text{gag-ker}(\{x_\lambda\})$ be weakly ultra fuzzy gag-separated from $\{y_\mu\}$ or $\text{gag-ker}(\{y_\mu\})$ be weakly ultra fuzzy gag-separated from $\{x_\lambda\}$. Then there exists a Fgag-OS \mathcal{M} such that $\text{gag-ker}(\{x_\lambda\}) \leq \mathcal{M}$ and $y_\mu \notin \mathcal{M}$ or $\text{gag-ker}(\{y_\mu\}) \leq \mathcal{M}, x_\lambda \notin \mathcal{M}$ implies $x_\lambda \in \mathcal{M}, y_\mu \notin \mathcal{M}$ or $x_\lambda \notin \mathcal{M}, y_\mu \in \mathcal{M}$. Thus, (X, τ) is a Fgag- T_0 -space.

Theorem 6.7: A FTS (X, τ) is Fgag- T_1 -space iff for each $x \neq y \in X$, $\text{gag-ker}(\{x_\lambda\})$ is weakly ultra fuzzy gag-separated from $\{y_\mu\}$ and $\text{gag-ker}(\{y_\mu\})$ is weakly ultra fuzzy gag-separated from $\{x_\lambda\}$.

Proof: Let (X, τ) be a Fgag- T_1 -space, then for each $x \neq y \in X$, there exist Fgag-OS \mathcal{U}, \mathcal{V} such that $x_\lambda \in \mathcal{U}, y_\mu \notin \mathcal{U}$ and $x_\lambda \notin \mathcal{V}, y_\mu \in \mathcal{V}$. Implies $\text{gag-ker}(\{x_\lambda\})$ is weakly ultra fuzzy gag-separated from $\{y_\mu\}$ and $\text{gag-ker}(\{y_\mu\})$ is weakly ultra fuzzy gag-separated from $\{x_\lambda\}$.

Conversely, let $\text{gag-ker}(\{x_\lambda\})$ be weakly ultra fuzzy gag-separated from $\{y_\mu\}$ and $\text{gag-ker}(\{y_\mu\})$ be weakly ultra fuzzy gag-separated from $\{x_\lambda\}$. Then there exist Fgag-OS \mathcal{U}, \mathcal{V} such that $\text{gag-ker}(\{x_\lambda\}) \leq \mathcal{U}, y_\mu \notin \mathcal{U}$ and $\text{gag-ker}(\{y_\mu\}) \leq \mathcal{V}, x_\lambda \notin \mathcal{V}$ implies $x_\lambda \in \mathcal{U}, y_\mu \notin \mathcal{U}$ and $x_\lambda \notin \mathcal{V}, y_\mu \in \mathcal{V}$. Thus, (X, τ) is a Fgag- T_1 -space.

Theorem 6.8: A FTS (X, τ) is Fgag- T_1 -space iff for each $x \in X$, $\text{gag-ker}(\{x_\lambda\}) = \{x_\lambda\}$.

Proof: Let (X, τ) be a Fgag- T_1 -space and let $\text{gag-ker}(\{x_\lambda\}) \neq \{x_\lambda\}$. Then $\text{gag-ker}(\{x_\lambda\})$ contains another fuzzy point distinct from x_λ say y_μ . So $y_\mu \in \text{gag-ker}(\{x_\lambda\})$ implies $\text{gag-ker}(\{x_\lambda\})$ is not weakly ultra fuzzy gag-separated from $\{y_\mu\}$. Hence by theorem (6.7), (X, τ) is not a Fgag- T_1 -space this is contradiction. Thus $\text{gag-ker}(\{x_\lambda\}) = \{x_\lambda\}$.

Conversely, let $\text{gag-ker}(\{x_\lambda\}) = \{x_\lambda\}$, for each $x \in X$ and let (X, τ) be not a Fgag- T_1 -space. Then by theorem (6.7), $\text{gag-ker}(\{x_\lambda\})$ is not weakly ultra fuzzy gag-separated from $\{y_\mu\}$ for some $x \neq y \in X$, this means that for every Fgag-OS \mathcal{M} contains $\text{gag-ker}(\{x_\lambda\})$ then $y_\mu \in \mathcal{M}$ implies

$y_\mu \in \wedge \{\mathcal{M} \in \text{Fgag-O}(X): x_\lambda \in \mathcal{M}\}$ implies $y_\mu \in \text{gag-ker}(\{x_\lambda\})$, this is contradiction. Thus, (X, τ) is a Fgag-T_1 -space.

Theorem 6.9: A FTS (X, τ) is Fgag-T_1 -space iff for each $x \neq y \in X$, $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$ and $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$.

Proof: Let (X, τ) be a Fgag-T_1 -space then for each $x \neq y \in X$, there exist $\text{Fgag-OS } \mathcal{U}, \mathcal{V}$ such that $x_\lambda \in \mathcal{U}$, $y_\mu \notin \mathcal{U}$ and $y_\mu \in \mathcal{V}$, $x_\lambda \notin \mathcal{V}$. Implies $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$ and $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$.
Conversely, let $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$ and $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$, for each $x \neq y \in X$. Then there exist $\text{Fgag-OS } \mathcal{U}, \mathcal{V}$ such that $x_\lambda \in \mathcal{U}$, $y_\mu \notin \mathcal{U}$ and $y_\mu \in \mathcal{V}$, $x_\lambda \notin \mathcal{V}$. Thus, (X, τ) is a Fgag-T_1 -space.

Theorem 6.10: A FTS (X, τ) is Fgag-T_1 -space iff for each $x \neq y \in X$ implies $\text{gag-ker}(\{x_\lambda\}) \wedge \text{gag-ker}(\{y_\mu\}) = 0_X$.

Proof: Let (X, τ) be a Fgag-T_1 -space. Then $\text{gag-ker}(\{x_\lambda\}) = \{x_\lambda\}$ and $\text{gag-ker}(\{y_\mu\}) = \{y_\mu\}$ [by theorem (6.8)]. Thus, $\text{gag-ker}(\{x_\lambda\}) \wedge \text{gag-ker}(\{y_\mu\}) = 0_X$.

Conversely, let for each $x \neq y \in X$ implies $\text{gag-ker}(\{x_\lambda\}) \wedge \text{gag-ker}(\{y_\mu\}) = 0_X$ and let (X, τ) be not Fgag-T_1 -space, then for each $x \neq y \in X$ implies $y_\mu \in \text{gag-ker}(\{x_\lambda\})$ or $x_\lambda \in \text{gag-ker}(\{y_\mu\})$ [by theorem (6.9)], then $\text{gag-ker}(\{x_\lambda\}) \wedge \text{gag-ker}(\{y_\mu\}) \neq 0_X$ this is contradiction. Thus, (X, τ) is a Fgag-T_1 -space.

Theorem 6.11: A FTS (X, τ) is Fgag-T_1 -space iff (X, τ) is Fgag-T_0 -space and Fgag-R_0 -space.

Proof: Let (X, τ) be a Fgag-T_1 -space and let $x_\lambda \in \mathcal{U}$ be a Fgag-OS , then for each $x \neq y \in X$, $\text{gag-ker}(\{x_\lambda\}) \wedge \text{gag-ker}(\{y_\mu\}) = 0_X$ [by theorem (6.10)] implies $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$ and $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$, this means $\text{gag-cl}(\{x_\lambda\}) = \{x_\lambda\}$, hence $\text{gag-cl}(\{x_\lambda\}) \leq \mathcal{U}$. Thus, (X, τ) is a Fgag-R_0 -space.

Conversely, let (X, τ) be a Fgag-T_0 -space and Fgag-R_0 -space, then for each $x \neq y \in X$ there exists a $\text{Fgag-OS } \mathcal{U}$ such that $x_\lambda \in \mathcal{U}$, $y_\mu \notin \mathcal{U}$ or $x_\lambda \notin \mathcal{U}$, $y_\mu \in \mathcal{U}$. Say $x_\lambda \in \mathcal{U}$, $y_\mu \notin \mathcal{U}$ since (X, τ) is a Fgag-R_0 -space, then $\text{gag-cl}(\{x_\lambda\}) \leq \mathcal{U}$, this means there exists a $\text{Fgag-OS } \mathcal{V}$ such that $y_\mu \in \mathcal{V}$, $x_\lambda \notin \mathcal{V}$. Thus, (X, τ) is a Fgag-T_1 -space.

Theorem 6.12: A FTS (X, τ) is Fgag-T_2 -space iff

- (i) (X, τ) is a Fgag-T_0 -space and Fgag-R_1 -space.
- (ii) (X, τ) is a Fgag-T_1 -space and Fgag-R_1 -space.

Proof: (i) Let (X, τ) be a Fgag-T_2 -space, then it is a Fgag-T_0 -space. Now since (X, τ) is a Fgag-T_2 -space, then for each $x \neq y \in X$, there exist disjoint $\text{Fgag-OS } \mathcal{U}, \mathcal{V}$ such that $x_\lambda \in \mathcal{U}$ and $y_\mu \in \mathcal{V}$ implies $x_\lambda \notin \text{gag-cl}(\{y_\mu\})$ and $y_\mu \notin \text{gag-cl}(\{x_\lambda\})$, therefore $\text{gag-cl}(\{x_\lambda\}) = \{x_\lambda\} \leq \mathcal{U}$ and $\text{gag-cl}(\{y_\mu\}) = \{y_\mu\} \leq \mathcal{V}$. Thus, (X, τ) is a Fgag-R_1 -space.

Conversely, let (X, τ) be a Fgag-T_0 -space and Fgag-R_1 -space, then for each $x \neq y \in X$, there exists a $\text{Fgag-OS } \mathcal{U}$ such that $x_\lambda \in \mathcal{U}$, $y_\mu \notin \mathcal{U}$ or $y_\mu \in \mathcal{U}$, $x_\lambda \notin \mathcal{U}$, implies $\text{gag-cl}(\{x_\lambda\}) \neq \text{gag-cl}(\{y_\mu\})$, since (X, τ) is a Fgag-R_1 -space [by assumption], then there exist disjoint $\text{Fgag-OS } \mathcal{M}, \mathcal{N}$ such that $x_\lambda \in \mathcal{M}$ and $y_\mu \in \mathcal{N}$. Thus, (X, τ) is a Fgag-T_2 -space.

(ii) By the same way of part (i) a Fgag-T_2 -space is Fgag-T_1 -space and Fgag-R_1 -space.

Conversely, let (X, τ) be a Fgag-T_1 -space and Fgag-R_1 -space, then for each $x \neq y \in X$, there exist $\text{Fgag-OS } \mathcal{U}, \mathcal{V}$ such that $x_\lambda \in \mathcal{U}$, $y_\mu \notin \mathcal{U}$ and $y_\mu \in \mathcal{V}$, $x_\lambda \notin \mathcal{V}$ implies $\text{gag-cl}(\{x_\lambda\}) \neq \text{gag-cl}(\{y_\mu\})$, since (X, τ) is a Fgag-R_1 -space, then there exist disjoint $\text{Fgag-OS } \mathcal{M}, \mathcal{N}$ such that $x_\lambda \in \mathcal{M}$ and $y_\mu \in \mathcal{N}$. Thus, (X, τ) is a Fgag-T_2 -space.

Corollary 6.13: A Fgag- T_0 -space is Fgag- T_2 -space iff for each $x \neq y \in X$ with $\text{gag-ker}(\{x_\lambda\}) \neq \text{gag-ker}(\{y_\mu\})$, then there exist Fgag-CS $\mathcal{M}_1, \mathcal{M}_2$ such that $\text{gag-ker}(\{x_\lambda\}) \leq \mathcal{M}_1$, $\text{gag-ker}(\{x_\lambda\}) \wedge \mathcal{M}_2 = 0_X$ and $\text{gag-ker}(\{y_\mu\}) \leq \mathcal{M}_2$, $\text{gag-ker}(\{y_\mu\}) \wedge \mathcal{M}_1 = 0_X$ and $\mathcal{M}_1 \vee \mathcal{M}_2 = 1_X$.

Proof: By theorem (5.11) and theorem (6.12).

Corollary 6.14: A Fgag- T_1 -space is Fgag- T_2 -space iff one of the following conditions holds:

- (i) for each $x \neq y \in X$ with $\text{gag-cl}(\{x_\lambda\}) \neq \text{gag-cl}(\{y_\mu\})$, then there exist Fgag-OS \mathcal{U}, \mathcal{V} such that $\text{gag-cl}(\text{gag-ker}(\{x_\lambda\})) \leq \mathcal{U}$ and $\text{gag-cl}(\text{gag-ker}(\{y_\mu\})) \leq \mathcal{V}$.
- (ii) for each $x \neq y \in X$ with $\text{gag-ker}(\{x_\lambda\}) \neq \text{gag-ker}(\{y_\mu\})$, then there exist Fgag-CS $\mathcal{M}_1, \mathcal{M}_2$ such that $\text{gag-ker}(\{x_\lambda\}) \leq \mathcal{M}_1$, $\text{gag-ker}(\{x_\lambda\}) \wedge \mathcal{M}_2 = 0_X$ and $\text{gag-ker}(\{y_\mu\}) \leq \mathcal{M}_2$, $\text{gag-ker}(\{y_\mu\}) \wedge \mathcal{M}_1 = 0_X$ and $\mathcal{M}_1 \vee \mathcal{M}_2 = 1_X$.

Proof: (i) By corollary (5.12) and theorem (6.12).

(ii) By theorem (5.11) and theorem (6.12).

Theorem 6.15: A Fgag- R_1 -space is Fgag- T_2 -space iff one of the following conditions holds:

- (i) for each $x \in X$, $\text{gag-ker}(\{x_\lambda\}) = \{x_\lambda\}$.
- (ii) for each $x \neq y \in X$, $\text{gag-ker}(\{x_\lambda\}) \neq \text{gag-ker}(\{y_\mu\})$ implies $\text{gag-ker}(\{x_\lambda\}) \wedge \text{gag-ker}(\{y_\mu\}) = 0_X$.
- (iii) for each $x \neq y \in X$, either $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$ or $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$.
- (iv) for each $x \neq y \in X$ then $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$ and $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$.

Proof: (i) Let (X, τ) be a Fgag- T_2 -space. Then (X, τ) is a Fgag- T_1 -space and Fgag- R_1 -space [by theorem (6.12)]. Hence by theorem (6.8), $\text{gag-ker}(\{x_\lambda\}) = \{x_\lambda\}$ for each $x \in X$.

Conversely, let for each $x \in X$, $\text{gag-ker}(\{x_\lambda\}) = \{x_\lambda\}$, then by theorem (6.8), (X, τ) is a Fgag- T_1 -space. Also (X, τ) is a Fgag- R_1 -space by assumption. Hence by theorem (6.12), (X, τ) is a Fgag- T_2 -space.

(ii) Let (X, τ) be a Fgag- T_2 -space. Then (X, τ) is a Fgag- T_1 -space [by remark (6.4)]. Hence by theorem (6.10), $\text{gag-ker}(\{x_\lambda\}) \wedge \text{gag-ker}(\{y_\mu\}) = 0_X$ for each $x \neq y \in X$.

Conversely, assume that for each $x \neq y \in X$, $\text{gag-ker}(\{x_\lambda\}) \neq \text{gag-ker}(\{y_\mu\})$ implies $\text{gag-ker}(\{x_\lambda\}) \wedge \text{gag-ker}(\{y_\mu\}) = 0_X$. So by theorem (6.10), (X, τ) is a Fgag- T_1 -space, also (X, τ) is a Fgag- R_1 -space by assumption. Hence by theorem (6.12), (X, τ) is a Fgag- T_2 -space.

(iii) Let (X, τ) be a Fgag- T_2 -space. Then (X, τ) is a Fgag- T_0 -space [by remark (6.4)]. Hence by theorem (6.5), either $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$ or $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$ for each $x \neq y \in X$.

Conversely, assume that for each $x \neq y \in X$, either $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$ or $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$ for each $x \neq y \in X$. So by theorem (6.5), (X, τ) is a Fgag- T_0 -space, also (X, τ) is a Fgag- R_1 -space by assumption. Thus (X, τ) is a Fgag- T_2 -space [by theorem (6.12)].

(iv) Let (X, τ) be a Fgag- T_2 -space. Then (X, τ) is a Fgag- T_1 -space and Fgag- R_1 -space [by theorem (6.12)]. Hence by theorem (6.9), $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$ and $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$.

Conversely, let for each $x \neq y \in X$ then $x_\lambda \notin \text{gag-ker}(\{y_\mu\})$ and $y_\mu \notin \text{gag-ker}(\{x_\lambda\})$. Then by theorem (6.9), (X, τ) is a Fgag- T_1 -space. Also (X, τ) is a Fgag- R_1 -space by assumption. Hence by theorem (6.12), (X, τ) is a Fgag- T_2 -space.

Remark 6.16: Each fuzzy gag-separation axiom is defined as the conjunction of two weaker fuzzy axioms: Fgag- T_k -space = Fgag- R_{k-1} -space and Fgag- T_{k-1} -space = Fgag- R_{k-1} -space and Fgag- T_0 -space, $k = 1, 2$.

Remark 6.17: The relation between fuzzy gag-separation axioms can be representing as a matrix. Therefore, the element a_{ij} refers to this relation. As the following matrix representation shows:

and	$Fg\alpha g-T_0$	$Fg\alpha g-T_1$	$Fg\alpha g-T_2$	$Fg\alpha g-R_0$	$Fg\alpha g-R_1$
$Fg\alpha g-T_0$	$Fg\alpha g-T_0$	$Fg\alpha g-T_1$	$Fg\alpha g-T_2$	$Fg\alpha g-T_1$	$Fg\alpha g-T_2$
$Fg\alpha g-T_1$	$Fg\alpha g-T_1$	$Fg\alpha g-T_1$	$Fg\alpha g-T_2$	$Fg\alpha g-T_1$	$Fg\alpha g-T_2$
$Fg\alpha g-T_2$	$Fg\alpha g-T_2$	$Fg\alpha g-T_2$	$Fg\alpha g-T_2$	$Fg\alpha g-T_2$	$Fg\alpha g-T_2$
$Fg\alpha g-R_0$	$Fg\alpha g-T_1$	$Fg\alpha g-T_1$	$Fg\alpha g-T_2$	$Fg\alpha g-R_0$	$Fg\alpha g-R_1$
$Fg\alpha g-R_1$	$Fg\alpha g-T_2$	$Fg\alpha g-T_2$	$Fg\alpha g-T_2$	$Fg\alpha g-R_1$	$Fg\alpha g-R_1$
