(Received on 23/6 /2008)

(Accepted for publication 31/12 /2008)

Abstract

This research involves the preparation Complex of Sn(II) with alanine in general formula $[Sn(Ala-H)_2]$ were (Alanine = Ala = $C_3H_7NO_2$) , the complex have been characterized by spectroscopic method [FT-IR , UV –Vis , Atomic absorption] along with molar conductivity measurements , chloride content , melting points and determination of the expected structures for complex , soon the mole ratio (L:M) by continues variation method (Job's method), stability constant(K_f)and Gibbs free energy(ΔG).

The proposed molecular structures of the complex drown according to computed program Chem. office 2003.

الخلاصة

تم تحضير وتشخيص معقد القصدير (II) مع الalanine ذو الصيغة العامة :
وشخص المعقد بالطرق الطيفية الآتية (الأشعة تحت الحمراء, $Ala=Ala=C_3H_7NO_2$, اذ $[Sn(Ala-H)_2]$) ان اذ
الأشعة فوق البنفسجية وطيف الامتصاص الذري) ، التوصيلية الكهربائية ، محتوى الكلور ، درجات الانصهار ،
وتحديد الشكل الفراغي المتوقع من خلال دراسة النسبة المولية (فلز : ليكанд) بطريقة التغيرات المستمرة (طريقة
جوب) . تم رسم الشكل المتوقع باستعمال البرنامج الجاهز (Chem . Office 3D(2000) . كذلك تم حساب ثابت
التكوين (K_f) والطاقة الحرجة لجبس (ΔG) للمعقد .

Introduction

The discovery of antitumor activity of cis-platin (cis-PtCl₂(NH₃)₂) has led the world wide researches to investigate the antitumor activity of thousand compounds of platinum and other metals . The main interest in transition metal complexes has remained, but the numbers of results for complexes of other complexes of amino acids/

derivatives have recently been discovered.¹⁻³ Besides some new platinum (II) and palladium (II)^{4,5,6,7} complexes,^{4,5,6,7} some oregano tin,⁸ lanthanide,⁹ gold,¹⁰ and copper¹¹⁻¹³ complexes.

In this paper we present the synthesis and study the complex Sn (Alaninato)₂ .

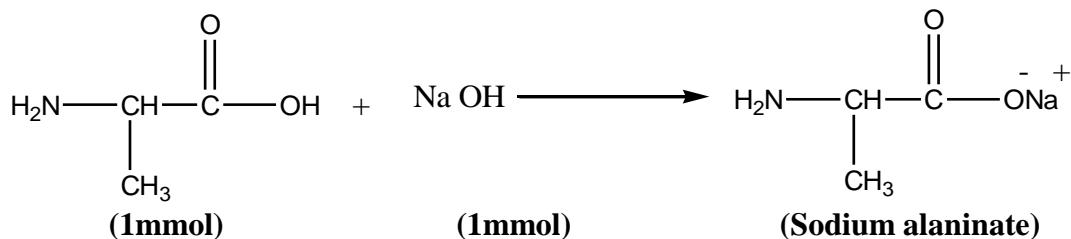

Experimental Methods

a- All the chemicals were reagent grad (fluke & BDH) and were used without further purification . FT. IR spectra were recorded as KBr discs using Fourie Transform Infrared Spectrophotometer Shimadzu 24FT-I.R8300. Electronic spectrum of the prepared complex were measured in the in DMF at 25°C using shimadzu-U. V-160A Ultra Violet Visible-Spectrophotometer with 1.000 ± 0.001 cm matched quartz cell. metal contents of the complex were determined by Atomic Absorption (A.A)Technique using Japan A.A-670 Shimadzu. Electrical

conductivity measurements of the complex were recorded at 25°C for 10^{-3} M solutions of the samples in DMF using pw 9527 Digital conductivity meter (Philips) . The modeling package chem. 3Dprog (ver 3,5,2)Cambridge soft (2000)

Melting points were recorded by using Stuart melting point apparatus .

b-General method¹⁴. Sodium alaninate ($\text{Na}^+\text{Ala}-\text{H}^-$) is prepared by neutralization of 1mmol(0.08 gm) of alanine acid with 1 mmol (0.04 gm) of NaOH according to the following reaction :

in water up on addition of aqueous solution of tin (II) chloride mole ratio (1:2), white–yello precipitate which was filtered and washed with (5ml) ethanol (5 ml) ether and dried at room temperature give (67%) , m.p = 216 (dec) , Sn% (Anal-found 43% - 44%) ,Cl% (Nill)The complexes are insoluble in water and common organic solvents but are soluble in DMF . The low values of the molar conductance ($5.26 \text{ mhos cm}^2 / \text{mol}$) of the solutions (10^{-3} M) of the complex in DMF at 298° K indicated that the complex is neutral .⁽¹⁵⁾

Results and Discuss

Spectral data (Table-1 and 2) are computable with the suggested structure (Fig.1) I.R Spectra

Table1: gives the characteristic absorptions for the free ligand and its complex .

The spectrum of free ligand (Fig.2) : The infra red spectrum of free ligand exhibited a strong band around (3379 cm^{-1}) that corresponds to the stretching vibration of $\nu(\text{N-H}) + \nu(\text{O-H})$, while another strong absorption band at (1618 cm^{-1}) is appeared which could explained as $\nu(\text{COO-})_{\text{asym}}$ where the $\nu(\text{COO-})$ symmetric stretching vibration of alanine or sodium alaninato was assigned band at (1411 cm^{-1})⁽¹⁶⁾

The spectrum of complex : The spectrum arising from the complex reveals that the absorption band belonging to the stretching vibration of $\nu(\text{N-H})$ of the amine group have been found in the (3421 cm^{-1}) . The IR

spectra show strong evidence in support of involvement of carboxylate group in coordination. In comparison with free aminoacids, in comparision with free aminoacids, the $\nu(\text{COO}^-)$ (asy) shows positive shifts and $\nu(\text{COO}^-)$ (sym) records negative shifts, which confirm that the carboxylate group attach to Sn metal as monodentate group.¹⁷

This increase in frequency on formation of the O-M bond may results from one of the carbon-to oxygen bonds having more double bond character than the other carbon-to-oxygen bond , although the bond between the central metal ion and the (COO⁻) group is essentially electrostatic . The band 356 and 423 cm⁻¹ are assigned to $\nu(\text{Sn-O})$ and $\nu(\text{Sn-N})$, respectively .^{17,18}

Table(1): Assignment of infrared frequencies in Cm⁻¹ of alanine and its complex Bis [Sn (Ala-H)₂]

compound	νNH_2 asy	$\nu(\text{NH}_2)$ sy	$\nu(\text{C-H})$	$\nu(\text{COO}^-)$ asy	$\nu(\text{COO}^-)$ sy	$\Delta (\text{COO}^- \text{ sy}$ $\text{COO}^- \text{ asy})$
Alaniae	٣٣٧٩	٣٠٨٧	٢٩٣٧	١٦١٨	١٤١١	٢٠٧
Sn (Ala-H) ₂	3421s-br	٣٠٨٩	٢٨٩٤	1625s	١٣٧٣	٢٥٢

The electronic spectrum of the ligand and its complex are listed in Table(2) together with the proposed assignments .The spectrum of the free ligand (Ala-H) in DMF solvent show two high intensity band in wave length 304 nm (32894 cm⁻¹) ϵ_{max} (3911.mol⁻¹.cm⁻¹) and 277nm. (36101 cm⁻¹) ϵ_{max}

(3431.mol⁻¹.cm⁻¹) assineddto ($n \rightarrow \pi^*$) and ($\pi \rightarrow \pi^*$) transition respectively.¹⁹ The low bands are observed in the region , 2337 ϵ_{max} and assigned as charge - transfer bands , indicating the formation of bond in the -bond and (p π - p π) bonds²⁰ between P - orbitals of oxygen and vacant 5d orbitals of tin.

Table (2): The Electronic Spectra for the Free Ligand (Ala) and its Complex [Sn (Ala-H)₂] in DMF (10⁻³M)

Compounds	λ (nm)	ν (cm ⁻¹)	$\epsilon(\text{max}) \text{ L.mol}^{-1} \text{ cm}^{-1}$	E(Kcal /mol)	Assignment

Proposed Molecular Structure

Studying complex on bases of the above analysis, the existence of tetra coordinated

[Sn (Ala-H)₂] , A proposed models of the speciese were built with chem 3D²¹ shows in Fig (1) .

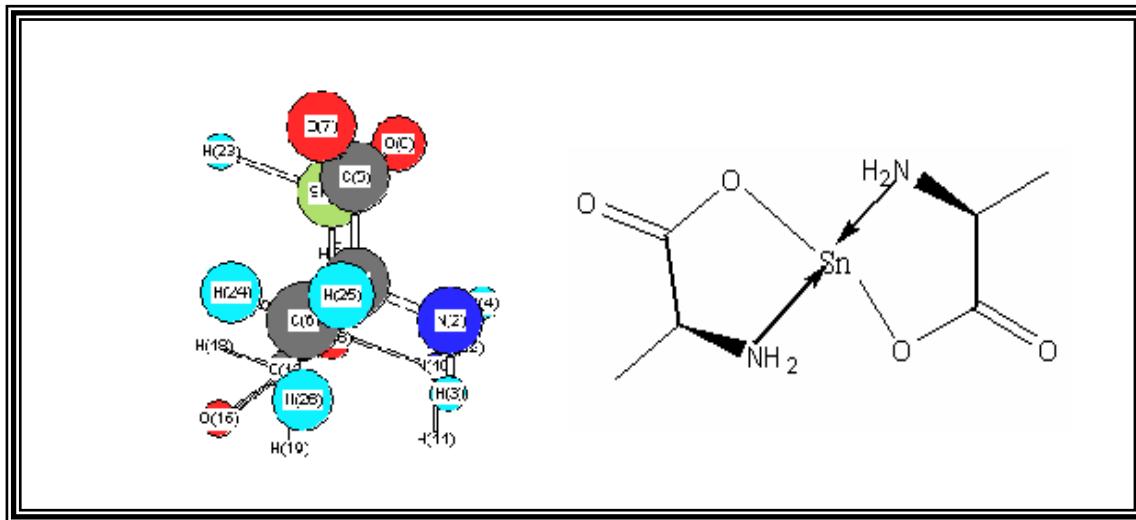

Fig (1) : The proposed molecular structure of the $[Sn(Ala-H)_2]$.

The Ligand coordinated to the metal ion as uninagative bidentate Ligands through the oxygen atom in the carboxyl group (COO^-) and the nitrogen atom of the ($-NH_2$), as shown below/Selected geometric parameter (A°) selected bond lengths and angles are presented in table(3) .

In the $[Sn(Ala-H)_2]$ complex alanine ligand is coordinated through N7 and O6 atoms as achelate ligand (Fig (1))The tin complex has distorted tetrahedral coordination with N-Sn-O, O-Sn-N, O-Sn-O and O-Sn-Nangles are equal from 104° to 125° .The bond lengths are: Sn(17)- O8:2.050 A° , Sn-O10:2.050 A° ^{21,22}.

The mole ratio (L:M) by continues variation method (Job's method), shows in Fig (2).

The results showed that Sn(II) complex were found in (2:1) ratio of L:M .

The stability of the complex in solution were investigation by evaluation of (K_f) (stability formation constants) by electronic spectra (fig :2 , table 4) and Gibbs free energy(ΔG) according to the following equation :^{22,23}

<i>Vm(ml)</i>	<i>VL(ml)</i>	<i>ABS</i>	<i>Vm / (Vm + VL)</i>	<i>VL / (Vm + VL)</i>
