## Abstract

In this paper, we define a new type of pairwise separation axioms called pairwise semi-p-separation axioms in bitopological spaces, also we study some properties of these spaces and relationships of each one with the ordinary separation axioms in the bitopological spaces.

**Keywords:** Bitopological space, pairwise semi-p- $T_0$ -space, pairwise semi-p- $T_1$ -space, pairwise semi-p- $T_2$ -space, pairwise semi-p-regular space, pairwise semi-p-normal space.

## 1-Introduction

The theory of bitopological spaces started with the paper of Kelly in [1]. A set equipped with two topologies is called a bitopological space. Since then several authors continued investigating such spaces. Furthermore, Kelly extended some of the standard results of separation axioms in a topological space to a bitopological space, such extensions are pairwise regular, pairwise Hausdorff and pairwise normal, concepts of pairwise  $T_2$  and pairwise  $T_1$  were introduced by Murdeshwar and Naimpally in [2].

The purpose of this paper is to introduce and investigate the notion of pairwise semi-p-separation axioms in bitopological spaces and study some properties of these spaces and relationships of each one with the ordinary separation axioms in the bitopological spaces.

## 2- Preliminaries

In this section, we introduce some definitions and propositions, which is necessary for the paper.

**Definition 2.1[3]:**

A subset  $A$  of a topological space  $(X, \tau)$  is called a *pre-open set* if  $A \subseteq \overline{A}^{\tau}$ . The complement of pre-open set is called *pre-closed set*.

The family of all pre-open subsets of  $X$  is denoted by  $PO(X)$ . The family of all pre-closed subsets of  $X$  is denoted by  $PC(X)$ .

**Proposition 2.2 [4]:**

Let  $(X, \tau)$  be a topological space, then:

- 1-Every open set is a pre-open set.
- 2-Every closed set is a pre-closed set.

But the converse of (1) and (2) is not true in general.

**Proposition 2.3 [4]:**

The union of any family of pre-open sets is a pre-open set.

**Definition 2.4[3]:**

The union of all pre-open sets contained in  $A$  is called the *pre-interior of  $A$* , denoted by  $\text{pre-int } A$ .

The intersection of all pre-closed sets containing  $A$  is called the *pre-closure of  $A$* , and is denoted by  $\text{pre-cl } A$ .

**Proposition 2.5 [4]:**

Let  $(X, \tau)$  be a topological space and  $A, B$  be any two subsets of  $X$ , then:  
 $\text{pre-cl } A \cup \text{pre-cl } B \subseteq \text{pre-cl } (A \cup B)$ .

**Definition 2.6 [4]:**

A subset  $A$  of a topological space  $(X, \tau)$  is said to be *semi-p-open set* if and only if there exists a pre-open set in  $X$ , say  $U$ , such that  $U \subseteq A \subseteq \text{pre-cl } U$ .

The family of all semi-p-open sets of  $X$  is denoted by  $S-P(X)$ .

The complement of semi-p-open set is called *semi-p-closed set*.

The family of all semi-p-closed sets of  $X$  is denoted by  $S-P-C(X)$ .

**Proposition 2.7 [4]:**

- 1- Every open (closed) set is semi-p-open (closed) set respectively.
  - 2- Every pre-open (pre-closed) set is semi-p-open (semi-p-closed) set respectively.
- Also, the converse of (1) and (2) is not true in general.

**Proposition 2.8:**

The union of any family of semi-p-open sets is semi-p-open set.

**Proof:**

Let  $\{A_\alpha\}, \alpha \in \Delta$  be any family of semi-p-open sets in  $X$ , we must prove  $\bigcup_{\alpha \in \Delta} A_\alpha$  is a semi-p-open set, since  $A_\alpha$  is semi-p-open set, for all  $\alpha \in \Delta$ , which implies there exists a pre-open set  $U_\alpha$  such that  $U_\alpha \subseteq A_\alpha \subseteq \text{pre-cl } U_\alpha$ .

Thus  $\bigcup_{\alpha \in \Delta} U_\alpha \subseteq \bigcup_{\alpha \in \Delta} A_\alpha \subseteq \bigcup_{\alpha \in \Delta} \text{pre-cl } U_\alpha$  and from (Proposition 2.3 and 2.5) we have a pre-open set  $\bigcup_{\alpha \in \Delta} U_\alpha$  such that  $\bigcup_{\alpha \in \Delta} U_\alpha \subseteq \bigcup_{\alpha \in \Delta} A_\alpha \subseteq \text{pre-cl } (\bigcup_{\alpha \in \Delta} U_\alpha)$ . Hence  $\bigcup_{\alpha \in \Delta} A_\alpha$  is a semi-p-open set. ■

**Definition 2.9 [4]:**

Let  $(X, \tau)$  be a topological space and let  $A$  be any subset of  $X$ , then:

- 1- The union of all semi-p-open sets contained in  $A$  is called the *semi-p-interior of  $A$* , denoted by  $\text{semi-p-int } A$ .
- 2- The intersection of all semi-p-closed sets containing  $A$  is called the *semi-p-closure of  $A$* , and denoted by  $\text{semi-p-cl } A$ .

**Definition 2.10 [4]:**

Let  $(X, \tau)$  be a topological space and let  $x \in X$ . A subset  $N$  of  $X$  is said to be *semi-p-neighborhood of  $x$*  if and only if there exists a semi-p-open set  $G$ , such that  $x \in G \subseteq N$ . We shall use the symbol nbd. instead of the word neighborhood.

If  $N$  is semi-p-open subset of  $X$ , then  $N$  is a semi-p-open nbd of  $x$ .

**Proposition 2.11:**

Let  $(X, \tau)$  be a topological space, then every semi-p-nbd is a semi-p-open set.

**Proof:**

Let  $N$  be any semi-p-nbds for each of its points, that is means for each  $x \in N$ , there exists a semi-p- open set  $G$  such that  $x \in G \subseteq N$ . now we must prove  $N$  is a semi-p-open set, since  $N = \bigcup_{x \in N} \{x\}$  and since  $N$  is a semi-p- nbd for all  $x \in N$ .

Thus  $N = \bigcup_{x \in N} \{G : G \text{ is a semi-p-open set such that } x \in G \subseteq N\}$ , and from (Proposition 2.8) we have  $N$  is a semi-p-open set. ■

**Definition 2.12 [1]:**

Let  $X$  be a non-empty set, let  $\tau_1, \tau_2$  be any two topologies on  $X$ , then  $(X, \tau_1, \tau_2)$  is called a bitopological space.

**Note 2.13:**

In the space  $(X, \tau_1, \tau_2)$ , we shall denote to the set of all semi-p- open sets in  $\tau_1$  ( $\tau_2$ ) by  $S-P(X, \tau_1)$  ( $S-P(X, \tau_2)$ ) respectively.

**Definition 2.14 [2]:**

A bitopological space  $(X, \tau_1, \tau_2)$  is said to be:

- 1- **Pairwise  $T_0$  - space** if for every pair of points  $x$  and  $y$  in  $X$  such that  $x \neq y$ , there exists a  $\tau_1$ -open set containing  $x$  but not  $y$  or  $y$  but not  $x$  or a  $\tau_2$ -open set containing  $y$  but not  $x$  or  $x$  but not  $y$ .
- 2- **Pairwise  $T_1$  - space** if for every pair of points  $x$  and  $y$  in  $X$  such that  $x \neq y$ , there exists a  $\tau_1$ -open set  $U$  and a  $\tau_2$ -open set  $V$  such that  $x \in U, y \in U$  and  $y \in V, x \notin V$ .

**Definition 2.15[1]:**

A bitopological space  $(X, \tau_1, \tau_2)$  is said to be:

- 1- **Pairwise  $T_2$  - space** if every two distinct points in  $X$  can be separated by disjoint  $\tau_1$ -open set and  $\tau_2$ -open sets.
- 2- **Pairwise regular space**, if for each point  $x \in X$  and each  $\tau_i$ -closed set  $F$  not containing  $x$ , there exists a  $\tau_i$ -open set  $U$  and  $\tau_j$ -open set  $V$  such that  $x \in U, F \subseteq V$  and  $U \cap V = \emptyset$ , where  $i \neq j$  and  $i, j = 1, 2$ .
- 3- **Pairwise normal space**, if for each  $\tau_i$ -closed set  $A$  and  $\tau_j$ -closed set  $B$  such that  $A \cap B = \emptyset$ , there exist sets  $U$  and  $V$  such that  $U$  is  $\tau_j$ -open,  $V$  is  $\tau_i$ -open,  $A \subseteq U, B \subseteq V$ , and  $U \cap V = \emptyset, i, j = 1, 2, i \neq j$ .

### 3-Pairwise semi-p-separation axioms

We begin with the definition of pairwise semi-p- $T_0$ - spaces.

**Definition 3.1:**

A space  $(X, \tau_1, \tau_2)$  is called *pairwise semi-p- $T_0$ - space* if for any pair of distinct points  $x$  and  $y$  in  $X$ , there exists a  $\tau_1$ -semi-p-open set or  $\tau_2$ -semi-p-open set which contains one of them but not the other.

**Proposition 3.2:**

If a space  $(X, \tau_1, \tau_2)$  is pairwise  $T_1$ - space, then  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_1$ - space.

**Proof:**

For any  $x, y \in X$  such that  $x \neq y$ , we must prove there exists a semi-p-open in  $\tau_1$  or  $\tau_2$  which contains one of them but not the other.

Now, let  $x \neq y$  in  $X$ , since  $(X, \tau_1, \tau_2)$  is pairwise  $T_1$ - space, then there exists open set  $U$  in  $\tau_1$  or  $\tau_2$  such that  $x \in U$  and  $y \notin U$ . But from (Proposition 2.7 part (1)) there exists semi-p-open set  $U$  such that  $x \in U$  and  $y \notin U$ . Thus  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_1$ - space. ■

**Remark 3.3:**

The converse of (Proposition 3.2 ) is not true in general, as the following example shows:

**Example 1:**

Let  $X = \{1, 2, 3\}$ ,  $\tau_1 = \{\emptyset, X, \{1\}\}$ ,  $\tau_2 = \{\emptyset, X, \{2, 3\}\}$ ,  $PO(X, \tau_1) = S-P(X, \tau_1) = \{\emptyset, X, \{1\}, \{1, 2\}, \{1, 3\}\}$ ,  $PO(X, \tau_2) = S-P(X, \tau_2) = \{\emptyset, X, \{2\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}\}$ . Then, clearly the space  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_1$ - space, but not pairwise  $T_1$ - space, since  $2 \neq 3$  in  $X$  but there is no open set  $U \in \tau_1$  or  $U \in \tau_2$  such that  $2 \in U$  and  $3 \notin U$ .

**Theorem 3.4 :**

For a space  $(X, \tau_1, \tau_2)$ , the following are equivalent :

- (1)  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_1$  -space .
- (2) For every  $x \in X$ ,  $\{x\} = \tau_1$  - semi - p - cl $\{x\} \cap \tau_2$  - semi - p - cl $\{x\}$ .
- (3) For every  $x \in X$ , the intersection of all  $\tau_1$  - semi - p - neighbourhoods of  $x$  and all  $\tau_2$  - semi - p - neighbourhoods of  $x$  is  $\{x\}$  .

**Proof: (1)  $\Rightarrow$  (2)**

Suppose  $x \neq y$  in  $X$ , there exists a  $\tau_1$ -semi-p-open set  $U$  containing  $x$  but not  $y$  or a  $\tau_2$ -semi-p-open set  $V$  containing  $y$  but not  $x$ . That means mean either  $x \notin \tau_1$  - semi - p - cl $\{y\}$  or  $y \notin \tau_2$  - semi - p - cl $\{x\}$ .

Hence for a point  $x$ ,  $y \notin \tau_1$  - semi - p - cl $\{x\} \cap \tau_2$  - semi - p - cl $\{x\}$  . Thus  $\{x\} = \tau_1$  - semi - p - cl $\{x\} \cap \tau_2$  - semi - p - cl $\{x\}$  .

**(2)  $\Rightarrow$  (3)**

Suppose there exists  $y \neq x$  such that  $y$  belongs to the intersection of all  $\tau_1$  - semi - p - nbds of  $x$  and all  $\tau_2$  - semi - p - nbds of  $x$ . Hence  $(X, \tau_1, \tau_2)$  is not pairwise semi-p- $T_1$ -space, implies  $\tau_1$ -Semi -pcl  $\{x\} \cap \tau_2$  - semi - p - cl $\{x\} \neq \{x\}$  which is a contradiction, thus the intersection of all  $\tau_1$  - semi - p - nbds of  $x$  and all  $\tau_2$  - semi - p - nbds of  $x$  is  $\{x\}$ .

**(3)  $\Rightarrow$  (1)**

Let  $x \neq y$  in  $X$ , since  $\{x\} =$  the intersection of all  $\tau_1$  - semi - p - nbds of  $x$  and  $\tau_2$  - semi - p - nbds of  $x$ . Hence, there exists either on  $\tau_1$  - semi - p - nbds of  $y$  not containing  $x$  or a  $\tau_2$  - semi - p - nbds of  $y$  not containing  $x$ . Therefore  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_1$ -space. ■

**Theorem 3.5:**

The product of an arbitrary family of pairwise semi -p- $T_1$  -spaces is pairwise semi- p- $T_1$  - space.

**Proof:**

Let  $(X, \tau_1, \tau_2) = \prod_{\alpha \in A} (X_\alpha, \tau_{1_\alpha}, \tau_{2_\alpha})$  be the product of an arbitrary family of pairwise semi-p- $T_1$ -spaces, where  $\tau_1$  and  $\tau_2$  are the product topologies on  $X$  generated by  $\tau_{1_\alpha}, \tau_{2_\alpha}$  respectively and  $X = \prod_{\alpha \in A} X_\alpha$ .

Let  $x$  and  $y$  be two distinct points of  $X$ . Hence  $x_\alpha \neq y_\alpha$  for some  $\alpha \in A$ . But  $(X_\alpha, \tau_{1_\alpha}, \tau_{2_\alpha})$  is pairwise semi-p- $T_1$ -space, therefore, there exists either a  $\tau_{1_\alpha}$ -semi-p-open set  $U_\alpha$  containing  $x_\alpha$  but not  $y_\alpha$  or a  $\tau_{2_\alpha}$ -semi-p-open set  $V_\alpha$  containing  $y_\alpha$  but not  $x_\alpha$ . Define  $U = \prod_{\alpha \in A} X_\alpha \times U_\alpha$  and  $V = \prod_{\alpha \in A} X_\alpha \times V_\alpha$ . Then  $U$  is a  $\tau_1$ -semi-p-open set and  $V$  is  $\tau_2$ -semi-p-open set, also,  $U$  contains  $x$  but not  $y$ . Hence  $\prod_{\alpha \in A} (X_\alpha, \tau_{1_\alpha}, \tau_{2_\alpha})$  is pairwise semi-p- $T_1$ -space. ■

**Definition 3.6:**

A space  $(X, \tau_1, \tau_2)$  is called *pairwise semi-p- $T_1$ -space*, if for any pair of distinct points  $x$  and  $y$  in  $X$ , there exists a  $\tau_1$ -semi-p-open set  $U$  and  $\tau_2$ -semi-p-open set  $V$  such that  $x \in U, y \notin U$  and  $y \in V, x \notin V$ .

**Proposition 3.7:**

If a space  $(X, \tau_1, \tau_2)$  is pairwise  $T_1$ -space, then  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_1$ -space.

**Proof:**

For any  $x \neq y$  in  $X$ , since  $(X, \tau_1, \tau_2)$  is pairwise  $T_1$ -space, then there exists  $\tau_1$ -open set  $U$  and  $\tau_2$ -open set  $V$  such that  $x \in U, y \notin U$  and  $y \in V, x \notin V$ . And since every open set is semi-p-open set (by Proposition 2.7 part (1)), which implies  $U$  is semi-p-open set in  $\tau_1$  containing  $x$  but not  $y$  and  $V$  is semi-p-open set in  $\tau_2$  containing  $y$  but not  $x$ . Hence  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_1$ -space. ■

**Remark 3.8:**

The converse of (Proposition 3.7) is not true in general as the following example shows: Consider Example 1, where:

$$X = \{1, 2, 3\}, \tau_1 = \{\emptyset, X, \{1\}\}, \tau_2 = \{\emptyset, X, \{2, 3\}\},$$

$$PO(X, \tau_1) = S-P(X, \tau_1) = \{\{\emptyset, X, \{1\}, \{1, 2\}, \{1, 3\}\},$$

$PO(X, \tau_2) = S-P(X, \tau_2) = \{\{\emptyset, X, \{2\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}\}$ . Then, clearly that the space  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_1$ -space, but not pairwise  $T_1$ -space, since  $2 \neq 3$  in  $X$ , but there is no  $\tau_1$ -open set containing 2 but not containing 3 and there is no  $\tau_2$ -open set containing 3 but not 2.

**Theorem 3.9:**

The product of an arbitrary family of pairwise semi-p- $T_1$ -spaces is pairwise semi-p- $T_1$ -space.

**Proof:** Similar to the proof of (Theorem 3.5). ■

**Definition 3.10:**

A space  $(X, \tau_1, \tau_2)$  is called *pairwise semi-p- $T_2$ -space*, if for any pair of distinct points  $x$  and  $y$  in  $X$ , there exists a  $\tau_1$ -semi-p-open set  $U$  and  $\tau_2$ -semi-p-open set  $V$  such that  $x \in U$ ,  $y \in V$  and  $U \cap V = \emptyset$ .

**Proposition 3.11:**

If a space  $(X, \tau_1, \tau_2)$  is pairwise  $T_2$ -space, then  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_2$ -space.

**Proof:** similar of the proof of (Proposition 3.7). ■

**Remark 3.12:**

The converse of (Proposition 3.11) is not true in general; consider example 1:

$$X = \{1, 2, 3\}, \tau_1 = \{\emptyset, X, \{1\}\}, \tau_2 = \{\emptyset, X, \{2, 3\}\},$$

$$PO(X, \tau_2) = S-P(X, \tau_2) = \{\{\emptyset, X, \{1\}, \{1, 2\}, \{1, 3\}\},$$

$PO(X, \tau_1) = S-P(X, \tau_1) = \{\{\emptyset, X, \{2\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}\}$ , clearly  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_2$ -space, but not pairwise  $T_2$ -space, since  $2 \neq 3$  in  $X$ , but there is no two disjoint open sets in  $\tau_1$  and  $\tau_2$ , which contain 2 and 3 respectively.

**Theorem 3.13:**

For a space  $(X, \tau_1, \tau_2)$ , the following are equivalent:

- 1-  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_2$ -space.
- 2- For each  $x \in X$  and for each  $y \in X$  such that  $y \neq x$ , there exists a  $\tau_1$ -semi-p-open set  $U$  containing  $x$  such that  $y \notin \tau_2$ -semi-pcl $U$ .
- 3- For each  $x \in X$ ,  $\{x\} \cap \{\tau_2$ -semi-pcl $U: x \in U \text{ and } U \text{ is } \tau_1$ -semi-p-open set}\} = \emptyset.
- 4- The diagonal  $\Delta = \{(x, x): x \in X\}$  is a semi-p-closed subset of  $(X \times X, \tau_{X \times X})$ .

**Proof:** (1)  $\Rightarrow$  (2)

Let  $x \in X$ , be given and consider  $y \in X$  such that  $y \neq x$ , since  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_2$ -space, there exists  $\tau_1$ -semi-p-open set  $U$  and  $\tau_2$ -semi-p-open set  $V$  such that  $x \in U$ ,  $y \in V$  and  $U \cap V = \emptyset$ . Hence  $y \notin \tau_2$ -semi-pcl $U$ , since we have a semi-p-open set  $V$  such that  $y \in V$ , but  $U \cap V = \emptyset$ .

(2)  $\Rightarrow$  (3)

Suppose that there exists  $x \neq y$  in  $X$ , such that  $y \in \{\tau_2$ -semi-pcl $U: x \in U \text{ and } U \text{ is } \tau_1$ -semi-p-open set}\}; implies  $y \in \tau_2$ -semi-pcl $U$ ;  $x \in U$  for all  $\tau_1$ -semi-p-open set  $U$ , which is a contradiction, thus for each  $x \in X$ ,  $\{x\} \cap \{\tau_2$ -semi-pcl $U: x \in U \text{ and } U \text{ is } \tau_1$ -semi-p-open set}\} = \emptyset.

(3)  $\Rightarrow$  (4)

To prove  $\Delta = \{(x, x): x \in X\}$  is a semi-p-closed subset of  $(X \times X, \tau_{X \times X})$ , that is mean we must prove  $X \times X \setminus \Delta$  is semi-p-open subset of  $(X \times X, \tau_{X \times X})$ .

Let  $(x, y) \in X \times X \setminus \Delta$ , which implies that  $x \neq y$ . In view of (3), there exists a  $\tau_1$ -semi-p-open set  $U$  containing  $x$  and  $y \notin \tau_2$ -semi-pcl $U$ .

We know that  $U \cap (X \setminus \tau_2\text{-semi-pcl} U) = \emptyset$ . Also, we have  $y \in (X \setminus \tau_2\text{-semi-pcl} U)$ . So  $(x, y) \in U \times (X \setminus \tau_2\text{-semi-pcl} U) \subset X \times X \setminus \Delta$ . But  $U \cap (X \setminus \tau_2\text{-semi-pcl} U)$  is a  $\tau_{X \times X}$ -semi-p-open set, so  $X \times X \setminus \Delta$  is a  $\tau_{X \times X}$ -semi-p-nbd of each of its points. Thus  $\Delta$  is  $\tau_{X \times X}$ -semi-p-closed set.

**(4)  $\Rightarrow$  (1)**

Let  $x \neq y$  in  $X$ , hence  $(x, y) \in X \times X \setminus \Delta$ . Since  $\Delta$  is  $\tau_{X \times X}$ -semi-p-closed set,  $X \times X \setminus \Delta$  is a semi-p-nbd of each of its points. Therefore, there exists a  $\tau_{X \times X}$ -semi-p-open set  $U \times V$  containing  $(x, y)$  and contained in  $X \times X \setminus \Delta$ , then  $U$  is  $\tau_1$ -semi-p-open set and  $V$  is  $\tau_2$ -semi-p-open set, also  $x \in U$  and  $y \in V$ , since  $U \times V \subset X \times X \setminus \Delta$ ,  $U \cap V = \emptyset$ . Thus  $(X, \tau_1, \tau_2)$  is pairwise semi-p- $T_2$ -space. ■

### Definition 3.14:

A space  $(X, \tau_1, \tau_2)$  is said to be *pairwise semi-p-regular-space*, if for each  $\tau_i$ -closed set  $F$  and for each point  $x \notin F$ , there exist  $\tau_i$ -semi-p-open set  $U$  and  $\tau_j$ -semi-p-open set  $V$  such that  $x \in U$ ,  $F \subset V$  and  $U \cap V = \emptyset$ , where  $i, j=1, 2$ ,  $i \neq j$ .

### Proposition 3.15:

Every pairwise regular space  $(X, \tau_1, \tau_2)$  is pairwise semi-p-regular-space.

#### Proof:

Let  $F$  be any  $\tau_i$ -closed set and let  $x \in X$ , such that  $x \notin F$ , since  $(X, \tau_1, \tau_2)$  is pairwise regular space, there exist  $\tau_i$ -open set  $U$  and  $\tau_j$ -open set  $V$  such that  $x \in U$ ,  $F \subset V$  and  $U \cap V = \emptyset$ .

And from (Proposition 2.5 part (1)), we have  $\tau_i$ -semi-p-open set  $U$  and  $\tau_j$ -semi-p-open set  $V$  such that  $x \in U$ ,  $F \subset V$  and  $U \cap V = \emptyset$ . Hence  $(X, \tau_1, \tau_2)$  is pairwise semi-p-regular-space. ■

### Remark 3.16:

The converse of (Proposition 3.15) is not true in general, as the following example shows:

Let  $X = \{1, 2, 3\}$ ,  $\tau_1 = \{\emptyset, X, \{1, 2\}\}$ ,  $\tau_2 = \{\emptyset, X, \{1, 3\}\}$ , then

$S-P(X, \tau_1) = \{\{\emptyset, X, \{1\}, \{2\}, \{1, 2\}, \{1, 3\}, \{2, 3\}\}$ ,

$S-P(X, \tau_2) = \{\{\emptyset, X, \{1\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}\}$ . Then  $X$  is pairwise semi-p-regular-space, but not pairwise regular space since  $\{3\}$  is closed set in  $\tau_1$  and  $1 \notin \{3\}$ , but for any  $\tau_1$ -open set containing 1 and for any  $\tau_2$ -open set containing  $\{3\}$ , its intersection is not empty.

### Theorem 3.17:

A space  $(X, \tau_1, \tau_2)$  is pairwise semi-p-regular-space if and only if for each point  $x$  in  $X$  and every  $\tau_i$ -closed set  $F$  not containing  $x$  there is a  $\tau_i$ -semi-p-open set  $U$  such that  $x \in U$  and  $(\tau_j\text{-semi-pcl} U) \cap F = \emptyset$ .

#### Proof:

Suppose  $(X, \tau_1, \tau_2)$  is pairwise semi-p-regular-space, let  $x \in X$  and  $F$  is any  $\tau_i$ -closed set such that  $x \notin F$ , implies  $X \setminus F$  is  $\tau_i$ -open set containing  $x$  and since  $(X, \tau_1, \tau_2)$  is pairwise

semi-p-regular- space, there is a  $\tau_i$ - semi-p-open set  $U$  such that  $x \in U \subset \tau_j$  semi  $\text{pcl}(U) \subset X \setminus F$ . Hence  $(\tau_j$  semi  $\text{pcl}(U)) \cap F = \emptyset$ .

Conversely, let  $F$  be any  $\tau_i$ - closed set and  $x \notin F$ , then there exists a  $\tau_i$ - semi-p-open set  $U$  such that  $x \in U$  and  $(\tau_j$  semi  $\text{pcl}(U)) \cap F = \emptyset$ .

Let  $V = X \setminus (\tau_j$  semi  $\text{pcl}(U))$ , then  $V$  is  $\tau_j$ -semi-p-open set such that  $F \subset V, x \in U$  and  $U \cap V = \emptyset$ , thus  $(X, \tau_1, \tau_2)$  is pairwise semi-p-regular- space. ■

### Definition 3.18:

A space  $(X, \tau_1, \tau_2)$  is said to be *pairwise semi-p-normal- space*, if for each  $\tau_i$ -closed set  $A$  and  $\tau_j$ - closed set  $B$  disjoint from  $A$ , there exist  $\tau_j$ - semi-p-open set  $U$  and  $\tau_i$ - semi-p-open set  $V$  such that  $A \subset U, B \subset V$  and  $U \cap V = \emptyset$ , where  $i, j=1, 2, i \neq j$ .

### Proposition 3.19:

Every pairwise normal space  $(X, \tau_1, \tau_2)$  is pairwise semi-p-normal- space.

### Proof:

Let  $A, B$  be two closed disjoint sets in  $\tau_i, \tau_j; i, j = 1, 2$  (respectively), since  $X$  is pairwise normal space, there exist  $\tau_j$ - open set  $U$  and  $\tau_i$ - open set  $V$  such that  $A \subset U, B \subset V$  and  $U \cap V = \emptyset$ , but from (Proposition 2.4 part (1))  $U, V$  semi-p-open sets which contains  $A$  and  $B$  respectively. Thus  $(X, \tau_1, \tau_2)$  is pairwise semi-p-normal- space. ■

### Remark 3.20:

The converse of Proposition 3.19 is not true in general, as the following example shows: Consider example 2, where:

$$X = \{1, 2, 3\}, \tau_1 = \{\emptyset, X, \{1, 2\}\}, \tau_2 = \{\emptyset, X, \{1, 3\}\},$$

$$S\text{-}P(X, \tau_1) = \{\{\emptyset, X, \{1\}, \{2\}, \{1, 2\}, \{1, 3\}, \{2, 3\}\},$$

$$S\text{-}P(X, \tau_2) = \{\{\emptyset, X, \{1\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}\}.$$

Then  $(X, \tau_1, \tau_2)$  is pairwise semi-p-normal- space, but not pairwise normal space, since  $\{3\}$  and  $\{2\}$  are closed disjoint sets in  $\tau_2$  and  $\tau_1$  respectively but for any open set in  $\tau_2$  which containing  $\{3\}$  and any open set in  $\tau_1$  which containing  $\{2\}$ , its intersection is not empty.

## الخلاصة

في هذا البحث قمنا بتعريف نوع جديد من بديهيات الفصل على الفضاءات التبولوجية الثنائية التي اسميناها بديهيات الفصل شبه  $P$ ، كذلك درسنا بعض خواص هذه الفضاءات وعلاقات كل نوع مع بديهيات الفصل الاعتيادية في الفضاءات التبولوجية الثنائية.

الكلمات المفتاحية: الفضاء التبولوجي الثنائي، الفضاء شبه  $T_2$ ، الفضاء شبه  $p$  –  $T_1$ ، الفضاء شبه  $p$  –  $T_2$ ، الفضاء شبه  $p$  – الاعتيادي.
