This review aimed to survey diatom composition in Iraqi waters. The facts were taken from surveys of phytoplankton in Iraq, covering freshwater and saline waters in diverse cities. A total of 454 taxa of the diatom group belonging to Bacillrophyceae class have been verified in the review. These taxa varied among 107 genera. The genus *Nitzschia* had a higher number of taxa followed via *Navicula*, *Cymbella*, *Fragilaria*, and *Gomphonema*, respectively. This study proposes to present a checklist of diatom composition in Iraq, built on the compilation of preceding investigations.

Keywords: Review, diatom, taxa, Iraqi water.**Introduction**

Various investigations have been investigated the taxa of diatom in Iraq in ecosystems such as rivers, lakes, marshes, or reservoirs. Diatoms belong to an enormous group termed the heterokonts, which embrace heterotrophs and autotrophs. Twenty thousand existed species of diatom, of which about twelve have been termed to date in accordance with [1]. About 1,300 genera have been prescribed, fossil and present [2][3] of which around 300 present solely like fossils [4]. The community of diatoms yields a huge amount of the air we breathe because of their capability in CO₂ fixation in processes of photosynthesis. Allotting and activities of diatom depend on various features that have [5][6]. Numerous studies described the significance of phytoplankton as bioindicators because of their reaction to the variation in an ecosystem [7][8]. The taxa of diatoms adduce a unified and inclusive valuation of the quality of water because they remain for a period of time, thus they signify the type of ambiance of environmental systems [9]. Diatoms play as a bespeaking of specific kinds of contaminants like heavy metals or organic, likewise, they play a turn in eutrophication [10][11]. In Iraq, numerous efforts have been exercised on diatoms identification. Consequently, this review presented information on the composition of diatom algal taxa in Iraq.

Sources and Methods

Literature review. Data were taken from sixty-nine references (55 research papers, four Ph. D. thesis, and ten M. Sc. thesis, dealing with the phytoplanktons. Data from the references were gathered to make the current list of diatoms. The references are [12- 80]: Abdulameer (2014), Al Azawey (2012), Al Fatlawi (2011), Al Zubaidi, *et al.* (2006), Al-Handal (1994), Al Hassany, *et al.*, (2014), Al-Hassany and Hassan (2014), Al- Rawi (2013), Al-Araji(1988), Al-Azawi (2004), Al-Handal, *et al.*, (1991), Ali, *et al.*, (2020), Alkam and Abdullah (2013), Alkam and Abdulmuneum (2012), Al-Khalidi and Al-Asady (2019), Al-Lami (1986), Al-Lami,

Results and Discussion

This checklist had 454 taxa of diatom group (427 recognized to species level) which varied among 107 genera (Table 1). This variation of diatom denoted to the diverse limnological features of Iraqi waters. The genus *Nitzschia* had a higher number of the taxa followed via *Navicula*, *Cymbella*, *Fragilaria* and *Gomphonema*, respectively (Table 2). The dominant genus was *Nitzschia*, one of the most common genera, because it is frequently found in organically polluted water and is known to favor relatively alkaline and slow-flowing water^[81,82].

Comparing with a review of non-diatom phytoplankton was done in 2020 via [83], the number of the taxa of the diatom was more than the number of the taxa of other phytoplankton which reached 342 taxa. The diatoms' domination in aquatic environments of Iraq is exactly known in all investigations to their capability to reproduce and develop in the common modification in the environment [84]. Other phytoplankton were less dominant, this may be as they have lesser numbers of species, likewise, they need various nutrients^[85,86].

The factors affect on qualitative of plankton. Uncontaminated ecosystems are known via high values of diversity. The existence, succession, number, or quality of phytoplankton were affected via grazing via zooplankton and via features of a system in waters^[87, 88, 89].

As an outcome, this review included 107 genera, among these genera, *Nitzschia* was dominant, representing about 11.46% of the detected species, followed via *Navicula* (11%), *Cymbella* (6. 6%), while some genera as *Aneumastus*, *Bacillaria*, *Balmella*, *Climacodium*, *Dinobryo*, *Eucampia*, *Gloeotheca*, *Hantzschia*, *Licmophora*, *Mallomonas*, *Paralia*, *Rhabdonema*, *Skeletonema*, and *Tryblionella* were represented by one species as represented in table (2). This review listed 427 species only because of relatively insufficient surveys on diatom groups from Iraqi waters.
