#### Abstract

This paper examines the critical role of morphology in first language (L1) learning and second language (L2) acquisition, addressing the challenges learners face in acquiring and internalizing morphological rules. The problem lies in understanding how morphological awareness—defined as the ability to reflect on and manipulate morphemes—contributes to vocabulary development, literacy, and grammatical competence, particularly in languages with complex inflectional systems. Drawing on data from existing studies on natural morphology and inflectional paradigms, this review explores cross-linguistic differences in morphological structures and their impact on language acquisition. The primary aim is to investigate how learners process and utilize morphological forms in diverse linguistic contexts and to identify implications for language instruction. Methodologically, this paper synthesizes research findings on morphological input through paradigms, explicit teaching strategies, and interactive activities designed to enhance learners' morphological awareness. The study concludes that explicit instruction in morphology, including tailored activities and paradigm-based learning, is essential for improving language

acquisition outcomes. It recommends the integration of morphological teaching techniques into language pedagogy to support vocabulary growth, reading comprehension, and grammatical accuracy for a broad spectrum of L1 and L2 learners.

**Keywords:** Morphology, Language Acquisition, Morphological Awareness, Cross-Linguistic Influence, Grammatical Competence.

#### الخلاصة

نتناول في هذه الورقة البحثية الدور الناقد الذي يلعبه علم الصرف في تعلم اللغة الأولى وأكتساب اللغة الثانية, ومعالجة التحديات التي تواجه المتعلمين في اكتساب القواعد الصرفية واستيعابها. تكمن المشكلة في كيفية فهم الوعي الصرفي – يعرف بانه القدرة على التفكير في التلاعب الصرفي – والاسهام في تطور المفردات, ومعرفة القراءة والكتابة, والكفاءة النحوية, وبخاصة في اللغات ذات الانظمة التصريفية المعقدة . والاستعانة ببيانات من دراسات القائمة الحالية حول علم الصرف الطبيعي والنماذج التصريفية , يستكشف هذا الاستعراض الاختلافات بين التركيبات الصرفية وتأثيرهم على أكتساب اللغة. الهدف الرئيسي هو التحقق في كيفية معالجة المتعلمين للأشكال الصرفية في سياقات لغوية متنوعة وتحديد الاثار المترتبة لتعليم اللغة. من الناحية المنهجية, يقوم هذا البحث بتلخيص نتائج الابحاث حول المساهمة الصرفية من خلال نماذج, واستراجيات التدريس الصريح, وانشطة تفاعلية مصممة الى تعزيز الوعي الصرفي للمتعلمين . وتستنتج الدراسة الى ان التعليم الصريح, وانشطة يتضمن الانشطة والنماذج المصممة خصيصاً المعتمدة على التعليم وهو المتوجيات التدريس الصريح, وانشطة اللغة. ويوصي بدمج تقنيات التريس الصرفي للمتعلمين . وتستنتج الدراسة الى ان التعليم الصريح في علم الصرف, يتضمن الانشطة والنماذ ج المصممة خصيصاً المعتمدة على التعليم, وهو امر ضروري لتحسين نتائج اكتساب البحث بتلخيص يتائج الابحاث دول المساهمة الصرفية من خلال نماذج, واستراجيات التدريس الصريح, وانشطة والعلية مصممة الى تعزيز الوعي الصرفي للمتعلمين . وتستنتج الدراسة الى ان التعليم الصريح في علم الصرف, يتضمن الانشطة والنماذج المصممة خصيصاً المعتمدة على التعليم, وهو امر ضروري لتحسين نتائج اكتساب اللغة. ويوصي بدمج تقنيات التدريس الصرفي الى علم اصول تدريس اللغة لدعم نمو الفردات, وفهم القراءة, والدقة النحوية لمجموعة واسعة من متعلمي اللغتين الاولى والثانية .

#### I. Introduction

Morphology is a basic segment of linguistic exploration that studies the structure as well as nature of words. The building blocks of words can be considered morphemes, which are the smallest units of meaning, and in combination with each other they make the fantastic diversity of words used in communication. Morphological knowledge is the foundation for both First Language (L1) and Second Language (L2) learners because it influences directly how users add to their vocabulary, enhance literacy skills, and become competent in grammar. In the context of L1 acquisition, children acquire intrinsic knowledge of morphology rules by exposure to the native language which empowers them to manipulate word forms in order to communicate tense,

number, gender, and case. With a grasp of these conventions, they also emerge with the ability to read and write sentences, an important milestone toward literacies and language richness. Morphological competence is similarly established well before children begin formal education. Children, first, learn language as an input in their early lives through caregiving and their environments in which they are raised. Naturally, they learn how words are composed from those elements called morphemes. As research suggests, the level of morphological awareness in early development— especially the ability to recognize, reflect on, and manipulate morphemes—strongly correlates with literacy development. Morphological awareness lets children segment words into their morphemic components, making reading and writing proficiency possible since they would learn decoding unknown words from known morphemes. This is the pay-off of such a skill at the point at which the child is transitioning from learning to read to reading to learn, in which vocabulary grows exponentially and comprehension becomes more sophisticated (Ravid, (2019).)

Morphological awareness is not limited to children acquiring their first language; it is equally relevant for learners of a second language. Unlike first language (L1) learners, second language (L2) learners often encounter entirely new word structures and patterns. For example, English Language Learners (ELLs) are taught that inflectional morphemes modify verb tenses or noun plurals, while derivational morphemes alter either the meaning of a word or its grammatical category. Decomposing words into their morphemic parts is crucial for vocabulary building, enhanced reading, and usage of grammar (Amirjalili, . (2018).)

Morphological knowledge in L2 acquisition vocabulary expansion and acquisition of grammatical competence. Children who possess a good morphological awareness will understand very complex words, especially those that contain more than one morpheme that is composed of prefixes, suffixes, and roots. Knowledge possessed by the student allows him/her to make inferences about new words using familiar morphemic patterns for reading comprehension and for communication inside a target language. Further, the familiarity of L2 learners with the distribution of morphemes in words makes it possible to better grammatical accuracy, especially for languages characterized by rich morphological systems, where conjugations of verbs and declensions of nouns play key roles in meaning (Bybee, (1991).)

The development of morphology, within both L1 and L2 acquisition settings, highlights the role of morphological awareness as a foundational skill in the teaching of language. By developing this awareness, learners break language apart and manipulate it at the word level, with tremendous implications for better vocabulary acquisition, improved literacy skills, and greater grammatical competence. This paper

probes into how morphological awareness shapes the role of language acquisition in determining vocabulary development, literacy, and grammatical accuracy among L1 and L2 learners. The paper is intended to illustrate insights into how morphological knowledge shapes language learning in various linguistic contexts, thereby suggesting adequate teaching strategies to be applied in the practice of a learner (Amirjalili, . (2018).)

This investigation into the morphology-language acquisition relationship is important because it would reveal in what way linguistic knowledge at the word level influences overall proficiency. Morpheme study provides insight into mechanisms of vocabulary growth, reading comprehension and linguistic accuracy. Acknowledging the role of morphological teaching as language educators recognize, attention goes to methods promoting learners' awareness of morphemes. For instance, teaching common morphemes (prefixes like "un-", "re-", and suffixes like "-ing", "-ed") can assist learners with new word meaning. Furthermore, teaching derivational morphology has the effect of making learners able to manipulate word forms and create new words, thereby improving their linguistic competence in general (Berko, (1958).)

Finally, the utility of morphological awareness in real-life use should be acknowledged: as for L1 learners, deep knowledge of morphemes assists them in passing from basic literacy to more complex language use, allowing them to deal with more complex texts and academic vocabulary. To learners of a morphological awareness serves as an aid in decoding unfamiliar words, understanding grammatical structures, and the ability to express oneself effectively in the target language. Thus, building morphological awareness through explicit instruction and practice is one of those tools that language educators can utilize very effectively in helping learners tap their full linguistic potential (Nagy, (1999). ) This paper investigates the role of morphological awareness in language acquisition by addressing specific research questions and hypotheses. It examines how morphological awareness influences vocabulary development, literacy, and grammatical competence in first language (L1) learners. It also explores the similarities and differences in the development of morphological awareness between L1 and second language (L2) learners and evaluates the impact of explicit teaching strategies focusing on morphological knowledge on L2 learners' vocabulary acquisition and grammatical accuracy. Furthermore, the study tests hypotheses, such as the contribution of morphological awareness to vocabulary development and literacy skills in L1 learners, the enhancement of grammatical competence in L2 learners through explicit instruction in morphological structures, and morphological correlation between awareness and improved the reading comprehension and communication skills in both L1 and L2 learners. Through these focused inquiries, the paper systematically investigates the intricate relationships

between morphology and language acquisition, offering valuable insights into how morphological awareness shapes linguistic competence.

#### **II.** Morphological Awareness in First Language Acquisition

Children acquire many bits of morphological information very early in the process of language development and use them as scaffolding for vocabulary and grammatical development. Indeed, (Ravid, (2019).)) points out that both inflectional and derivational morphology play critical roles early in L1 acquisition; children acquire the morphemes to be used as a means of modifying meanings and grammatical forms. Nonce words" like those used in the experiments, such as (Berko, (1958). ) famous "Wug Test," demonstrate how children use morphological rules learned earlier for novel words, thus showing an implicit understanding of the morphology. The overuse of such rules by children and application to irregular verbs with "ed" for past tense depict the nature of this developmental process as observed in children's inflectional morphology (Bybee, (1991).)

Other research involves Snyder 1995, which looks into how children's development in terms of morphological ability is ascertained by the salient features of a language's morphology. His conclusions are that the child's mastery of morphology is influenced both by the linguistic input and by universal cognitive factors ruling language acquisition. In this regard, Dominguez has proposed that morphological rules have formal features that guide L1 and L2 learners both toward an understanding of the structural parts of language.

In the initial stages of language development, children gradually come to own the concept of morphemes because they begin to understand how alterations in a word's form have implications for its meaning. It is well documented that morphological awareness appears to be a developmental construct, accompanying phonological awareness while only growing in strength with age as the child increases in their literacy. (Anglin, (1993).) showed that first graders can produce morphologically complex words, exerting early control over inflectional morphology. The study found that the children with a higher level of morphological awareness could better play around morphemes to create new words and, therefore, add new words to their vocabulary.

Morphological awareness is very closely related to vocabulary as well. According to McBride-Chang *et al.* (2005) the ability to understand or manipulate morphemes-that is, prefixes and suffixes in words-enables children to decipher new words and meanings. Thus, children with a robust sense of morphological awareness are best prepared to confront novel vocabulary. Such sensitivity is quite vital in languages like

آذار ۲۰۲۵

English, where inflectional morphology serves as the majority of conveyors of grammatical relations between words (verb tense, pluralization, etc.).

Inflectional and derivational morphology have been highlighted features in most first language acquisition studies. Inflectional morphology comes to refer to changes in the form of the word that suggest grammatical categories such as tense, number, or aspect. In contrast, derivational morphology refers to adding affixes to a base word with the aim of changing the meaning or grammatical category. According to (Ravid, (2019).)children not only need to acquire knowledge of these morphological rules but also develop the metalinguistic ability to apply them flexibly across different contexts.

Children's learning of inflectional morphology often begins with very simple grammatical rules, for example adding -s to make a noun plural or using the -ed form in past tense to verbs. The child generalizes these simple examples to more complex morphological patterns, such as irregular verb forms and derivational affixes that affect a word's meaning or category. This developmental trajectory especially in reading comprehension plays an important role since children use their morpheme knowledge to break down words into manageable components so that word recognition and meaning-making are fostered (Nagy, (1999). )

Morphological awareness profoundly influences literacy development, especially in reading and writing. The more children acknowledge morphemes, the better they will be able to decode words, which therefore assists in improving fluency and reading comprehension. Siegel (2008) found that better developing morphological awareness was associated with greater success of children in reading complex words, especially those multiple-morpheme bearing. This ability to segment the word into morphemes may allow young readers to access the meanings of unfamiliar words more effectively, thus contributing to better reading outcomes.

(Anglin, (1993).), demonstrated that first graders who can manipulate morphemes fare better at word reading. This is because they could take advantage of the morphological rules and patterns of base forms of words for the quicker recognition of both familiar and unfamiliar words. The link of morphological awareness with word reading turns out to be particularly strong in languages whose orthographies are unpredictable, in which decoding would appear to be largely inadequate for the reading of words.

Morphological awareness of L1 acquisition can be said to involve very intricate cognitive activities that transcend simple memorization of rules. Children ought to engage in metalinguistic thinking-that is, thinking about the structure and functions of language. McBride-Chang *et al.* (2005) stressed that morphological awareness involves declarative knowledge of morphological rules together with procedural knowledge as

to when, why, and how to apply such rules. The metalinguistic awareness is very important for children because they hear and read spoken and written morphologically complex words.

Moreover, morphological awareness is developmental; children grow from dependence on phonological cues to more complex and abstract awareness of the parts. Ravid defined that trajectory as thus: "Children begin to mark simple inflections, for instance, the plural '-s', followed by very complex derivations, including the ability to form entirely novel words by adding affixes." Increased awareness aids the child in "maneuvering the complexities of their language's morphological system.".

Given the role of morphological awareness in L1 acquisition, educators should encourage the inclusion of morphological instruction within early literacy programs. Children learn to identify and play with morphemes, which considerably boosts their reading and writing abilities. When word building, base word identification, and using prefixes and suffixes become activities included in programs, a child becomes more deeply aware of morphemes.

For example, explicit instruction in both inflectional and derivational morphology can enable children to understand words better as they change their meaning and grammatical form, thus enhancing their vocabulary and literacy skills. For example, teaching children about common morphemes such as "-ed," " -ing," and "-ly" is useful in decoding and reading texts. In addition, an integration of morphological instruction with phonological awareness exercises will shape a holistic literacy learning environment because, after all, there is a connection between the two in literacy development (Fumero, (2020).)

In first language acquisition, morphological awareness plays a significant role as it influences vocabulary growth and also impacts reading comprehension. More than that, it plays a crucial role in one's linguistic competence. Various studies have pointed out how the ability of children to detect and change morphemes mainly impacts early literacy development. As children master both inflectional and derivational morphology, they make significant progress in the means through which language is used to express meaning and also in understanding implicit, complex word structure. For teachers, adding morphological instruction to the literacy program can be geared towards preparing children in nailing the linguistic challenges of reading and writing and ultimately favoring their long-term academic success (Anglin, (1993).)

#### III. Morphology in Second Language Acquisition

Acquiring a second language (L2) requires learning a complex system of several linguistic subsystems, including phonology (the sound structure of language), morphology (word structure), and syntax (sentence structure). The interaction of these subsystems with the learner's first language (L1) plays a critical role in shaping the rate of acquisition, degree of success, and challenges encountered. This review synthesizes findings from recent research on how adult learners acquire L2 phonology, morphology, and syntax and how L1 structure influences this process.

Phonological acquisition is often one of the most visible challenges encountered by the L2 learner. Research indicates that L1 phonological structures can be a facilitator or a barrier to acquiring the sounds of the target language. Hawkins and Lozano (2006) discuss the degree to which the phonology system of an L1 may constrain or indeed facilitate a child's acquisition of L2 phonology. Transfer of L1 phonology to L2 is commonly seen where there is great phonetic difference between the two languages in question. For instance, while the Spanish learner may have difficulties with trilled /r/ sounds not found in his native language's phonetic inventory, the Japanese learner of English may have a different set of problems with the /l/-/r/ sounds, which are neutralized in Japanese.

Phonological acquisition in L2 is largely influenced by factors such as age of acquisition and exposure to the target language. Early learners are more likely to have native-like phonological proficiency as opposed to the late acquirer, who retains an accent from the L1. Snyder identifies further the relationship between phonology and morphology where sound distinctions mastered are seen to be essential for mastering and utilizing rules of morphological knowledge in the L2 (Snyder, (1995))

L2 morphological acquisition presents particular difficulties, especially when the morphological systems of the L1 and L2 differ considerably. For instance, English is morphologically relatively simple compared to a language like Russian or Turkish whose inflectional systems are more elaborate. However, even in the case of the English language, there are major problems in some of the morphological markers (2008).representing tense, aspect, and agreement (Ayoun, ) (Friedline, (2011).)suggests that a derivational morphology, which is creating new words from the use of a root, such as "happiness" from "happy", poses a big challenge for many L2 learners of English. Inflectional morphology presents other bundles of challenges, including marking grammatical categories such as tense and number. For example, the problems L2 learners of Spanish face in building causative and anticausative are realized by (Montrul, (2001).) based on complex morphological rules that govern the inflection of verbs.

Among those aspects of language development, the relation between syntax and morphology is an essential one, and L2 learners are usually likely to face challenges in combining these two systems. Syntax governs sentence structure, and in complex agreement languages, morphological markers are used to provide meaning, so there is a very strong connection between syntax and morphology. Snyder claims that when learners fail to master the morphological competence, they cannot achieve the syntactic rules of the target language (Lardiere, (2017).)

According to (Rocca, (2002).) the acquisition of tense-aspect morphology is closely related to the development of syntactic structures. In this connection, she established that the rate of acquisition of verb morphology was found to vary differently among learners of typologically different languages, such as Italian and English, owing to the difference in the syntactic and morphological characteristics of the target language. Learners from a language which is similar in structure to the L2, syntactically speaking, will find it easier to handle tense and aspect morphology because of similarities in how both may encode for them.

Another recent study explores how the syntactic knowledge of L2 learners is constructed around the morphological markers represented by the L1. For example, language learners in verb-subject agreeing languages have to learn those morphological agreement markers of agreement so that they can be able to form syntactically adequate sentences. This only becomes the problematic condition when the L1 has no such agreement marker, and the transfer of elements to the L2 results in error. One of the other focuses of L2 acquisition research deals with how L1 influences constrain L2 morphology learning (Montrul, (2001).). examines the variation among L2 learners in the acquisition of argument-structure-changing morphology, as in causative verbs, as a function of their L1. Montrul finds that the learners with a native background language more similar to the L2-morphology, that is, closer to the Spanish type, like Turkish or Japanese, acquired the morphological rules of Spanish much more easily than their counterparts speaking English as a first language.

For L2 learners, morphology presents a challenge but also an opportunity. Acquisition of morphological rules of the target language can be quite difficult if the target language is different from the learner's native language in terms of morphological structure. For instance, acquiring morphological inflections of English verbs or tense-aspect morphology may be challenging for subjects whose languages are not based on similar morphological markers (Bardovi-Harlig, (1998).)

Bardovi-Harlig explains adult learners' acquisition of English tense-aspect morphology: "Stress is given to interactions between lexical and grammatical

procedures." She reports that adult learners "initially rely heavily on lexical cues before they can fully develop morphological competence." In contrast, (Rocca, (2002). )examines children's L2 Italian verb morphology development and finds that differences in verb morphology develop with L1 syntactic and morphological structures.

Shirai's work in 1991 further underscores the notion of morphological clues used in L2 acquisition, and less cluttered input tends to make it easier for learners to pick up core grammatical structures. In his essay on the "Aspect Hypothesis Shirai suggests that during L2 acquisition, with regard to tense-aspect morphology, learners tend to look primarily at inherent lexical aspects such as whether the verb refers to a state or action before they acquire complex inflectional rules (Comajoan, (2006).)

## **IV. Cross-Linguistic Perspectives on Morphological Processing**

Cross-linguistic research opens a wider perspective for understanding morphology's role in acquisition. Languages differ dramatically in their morphological load. Hebrew is one of such languages: the load is high as early as in the earliest period in acquisition. (Bentin, (1995))demonstrate that children from the Hebrew-speaking environment will be provided with advantages as a result of explicit morphological instruction, which balances the development of vocabulary and literacy.

Similarly, (Snyder, (1995))observes that the greater a learner relies on syntactic and semantic marking rather than morphological marking, the less overt the morphological system of the language in question. This is an important observation in discussing what L2 learners find difficult, especially in a language like English that has a relatively simple morphological system compared to others, such as the agglutinative or inflectional Turkish or Finnish.

#### V. The Role of Morphology in Language Variation

Another important role played by morphological variation in language is in language acquisition and processing. In this regard, Snyder, 1995 states that how easy it would be for a learner to acquire certain grammatical structures depends on the morphology of the language, such as whether there is the overt presence or absence of some morphemes in the language or not. It implies that learners of the languages that are more morphologically rich might become morphologically more advanced than learners whose languages have least morphological rules.

Morphology is an important aspect in getting a better understanding on the acquisition of languages and how they are distributed in languages generally. Morphemes, being

the smallest unit of meaning, structure helps learners to acquire their native and as well as second languages L1 and L2, respectively. Varied linguistic systems of morphemes present across different languages create differences in the way learners acquire language structures. This review discusses the interplay between morphology and language acquisition, focusing on the effects of morphology on language variation, the role of morphology in complex predicate and argument structure learnability, and L1 constraints on L2 acquisition. The paper also examines whether linguistic variation in the first language makes a difference in the acquisition process, specifically in alphabetic writing systems (Montrul, (2001).)

While morphological awareness is crucial for both L1 and L2 acquisition, learning an L1 corresponds to becoming attuned to how to combine morphemes to generate meaningful words as well as to interpret grammatical structure. (Snyder, (1995))argues from child language acquisition research that complex predicates and morphological compounds are central to such development. Cross-linguistic variation provides powerful evidence of the relation between these complex predicates and morphological structures, and it does so in favor of the idea that morphology is involved in supporting the process by which learners master control of complex inputs from their linguistic environments.

The fact that errors invariably arise in L2 acquisition due to a constraint from L1 morphological patterns has made this aspect contribute to confining the process. Using causative verbs (Montrul, (2001).)discusses how first-language-constrained variability can influence learners' acquisitions of argument-structure-changing morphology. Montrul's study showed that learners' morphological errors arise via an inappropriate extension of L1 morphological rules into L2 structures that result in mistaken interpretations of verb forms and argument structures. This finding is significant for the theory of how L1 shapes the acquisition of the morphology of L2.

Languages vary considerably in their morphological characteristics and, hence, pose diverse difficulties depending on the linguistic environment for a learner. Alphabetic languages, for example, are varied in their morphological source, which has an influence on the learning and processing in language. (McNamee, (2009).) looked into how morphological variation of alphabetic languages impacts the learning process, especially in terms of inflectional and derivational morphology. Their research results suggest that, for the most part, language-specific morphological variation adds problems for learners in facing unpredictable forms and word change.

Language variation, therefore, affects learners in their acquisition of morphological rules. This does not entail that the complexity of a language's morphological system

آذار ۲۰۲۵

impacts or complicates acquisition. For example, languages with vast inflectional systems-that is, Russian or Arabic-have great amounts of morphological awareness because the system of verb conjugations and noun declensions is very complex. (Dominguez, (1991).) "Morphological Systems in Other Languages. Conclusion With all this, one might be tempted to conclude that the greater the complexity of a language's morphological structure, the more it will hinder learning. While it is true that languages with less complex morphologies might focus more on syntax rather than morphology, as in many cases with English, however, a learner's native language can still have an influence on L2 acquisition, as is well known in morphology.

In general, L1 influence on L2 acquisition, especially in the case of morphology, has been rather well accounted for by (Montrul, (2001).) among others, which further supports the fact that, at one point or another, L2 learners are constrained in their capacity to form new L2 morphological structures by L1 morphological patterns. An interest in the role of morphology in language acquisition pushes her to research such forms as argument-structure-changing morphology, which she demonstrates results in the causative verb and many other forms being overused or misused because of L1 constraints. This contributes to showing why knowing the role of L1 influences on the acquisition of L2 morphology would be valuable for instruction based on specific actions toward overcoming those constraints.

Another theory, Processability Theory, advanced by (Dyson, (2009).) explains L2 morphological acquisition. According to it, it seems that the learners gradually learn L2 morphology through acquiring progressively less complex morphological structures. It asserts that the acquisition of this cognitive ability to process more and more complex morphological rules has to develop, yet through the learner's L1 or L2 morphological structure, the ability can be changed. Further support to this process of gradual acquisition is added by the longitudinal research of Dyson, a process whereby learners progress through a number of stages in gradually taking them from mastering basic morphological rules to being able to acquire complex forms.

Morphological variation is not confined only to language learning situations. It extends right across the dialect and the sociolinguistic groups. (Gaeta, (2015).) elaborates on the topic of evaluative morphology, which means that the usage of morphemes to express attitudes or evaluations in a particular way, such as diminutives or augmentatives. There is much variation concerning dialects and sociolects. It greatly influences learners in the acquisition and use of morphological structures due to these users having to learn not only the standard forms of a language but also variations in informal or regional speech. For the learner, this generally creates an extra level of

complication to the process since they ought to understand when the morphological rules play a different role in the social and regional context.

Tamminga also explores the persistence in phonological and morphological variation in linguistic production presented as variation being a dynamic process affected by both cognitive and social aspects. Tamminga's work points out that morphological variation is not a static phenomenon but rather an indication of those real changes in speech use and the languages wherein it is rendered. This further creates additional difficulties for learners who have to accommodate both the standard morphological rules that govern their new language and the commonly uttered variations that occur in speaking practice (Tamminga, (2016). )

(Dominguez, (1991). )has explained the morphological variation across languages such as Spanish and English, which impacts the process of language acquisition for learners. According to him, "the learner of Spanish-a language of a fairly complicated system of inflectional morphology-must be an attentive sensitizer of very complex rules of morphological composition, whereas the learner of English places most emphasis on syntactic structure.".

Morphology has been an area of linguistic literature on the topic of language acquisition and variation, touching on the aspects of the life of both the L1 and L2 learner, with their complexity adding depth to the variation present between languages and dialects, and hence, differing degrees of difficulty for the learners. However, cross-linguistic studies emphasize how researchers need to understand how morphological awareness develops and how constraints imposed by L1 may shape the acquisition of L2 morphology. Another factor, potentially of sociolinguistic nature, that enters the picture is dialectal variation. Establishing one dialect or another requires not only the generalization strategies of the full set of morphological markers and rules but also the learner's adaptation to many different kinds of morphological systems (Gaeta, (2015).)

Future research should focus more extensively on the complex interplay between morphology and language acquisition, exploring the mechanism by which learners handle such complexities while using either formal or informal learning contexts.

#### VI. Implications for Language Teaching

Such important findings made about morphology in research translate into benefits for language instruction. Teachers can use morphological awareness as a tool for enhancing the linguistic competence of L1 and L2 learners. Literacy and language proficiencies will be improved significantly through explicit instruction in morpheme recognition, word formation, and the use of morphological rules (Nagy, (1999).) It can

also be designed for the specific learning situation-the area of morphology that an activity may target, such as inflectional morphology for very young learners or derivational morphology for more advanced users of a language.

#### VII. The Role of Morphological Paradigms in Language Learning

The concept of paradigms deals with the structure of words and how morphemes are combined to form words. In this way, paradigms help organize sets of related word forms for the linguistic purpose of understanding inflectional patterns and word formation within the different languages. The paradigmatic structures are thus relevant to L1 as well as L2 learners as they learn the complex morphological rules in the process of acquiring language. This review will address the role of paradigms in morphological acquisition, specifically in terms of how they assist learners to achieve word formation, inflection, and grammatical structure. The development of this review will be defined through research that underlines the function of paradigms in both L1 and L2 learning experiences (Boyé, (2016).)

The concern with respect to morphological paradigms has therefore been great, in that they represent frameworks which could potentially organise linguistic information. (Boyé, (2016).) outline how paradigms have a central role in a number of proposals on the morphological theories, including WP models, in which the relations amongst word forms within a paradigm play a critical role.

This paper is at the center of the definition of morphological exponence-the realization of grammatical categories by means of morphological markers-and how learners happen to appropriate complex morphological systems.

In paradigms, often, a base form is the stem to which other related forms are creatively applied from, making the inflectional patterns easier to learn. In this regard, (Albright, (2002).) talks about how learners use base forms in projecting a rest of the paradigm. He further explains that learners use stochastic morphological rules-probability-driven rules-to predict how other forms of a paradigm are made. This paradigm acquisition method, wherein one form functions as the basis for others, is essential in both L1 and L2 environments. The learner must know how systematically different grammatical features - tense, number, or case - are marked within a paradigm.

Inflectional paradigms, by arranging word forms according to grammatical categories such as tense, mood, number, or case, are fundamental to comprehension of how morphological knowledge is acquired by language learners. As argued for by (Blevins, (2016).), the WP approach puts paradigms at the heart of morphological analysis, basing the hypothesis on internalizing relationships in a paradigm between different

forms of words that learners take into their lexicon. Inflectional paradigms support the ability of children to understand affixes in changing base forms to produce grammatical meaning while providing an architectural framework that will make sense for the learning of intricate word forms.

Parades have special relevance for rich inflectional systems in languages, where word forms can change dramatically in grammatical context. Acquisition examples of this kind include verbal conjugations or noun declensions in Russian or Finnish, for example. (Pirvulescu, (2002).) discusses the derivation of verbal inflectional paradigms from morphosyntactic constraints-the formalization of what is possible within a given language regarding grammatical features like tense and aspect. For learners, this implies taking control of the interplay of morphology and syntax, which feeds into the production of grammatically correct word forms.

Base form identification is one salient characteristic of paradigm learning. Base forms are the anchors from which other inflected or derived forms ought to be generated. In his paper, (Albright, (2002).) shows how learners exploit such base forms to project the rest of the paradigm. The probabilistic rules governing this process allow learners to make predictions on how other word forms will be realized given the patterns they have identified for the base form. If a person knows, therefore, how a certain verb operates in the present tense, they would predict how it will operate in the past tense given the morphological patterns that are available in the paradigm This process of identification also is of great importance for both L1 and L2 acquisition. For L1, children have to learn how to identify which of the forms in a paradigm are the base and how all other forms are related to that base. For learners of an L2, previous experience with paradigms in their L1 may be used to predict how new paradigms in the L2 would be organized. These errors can occur when paradigmatic structures of L1 and L2 vary significantly. For example, because the paradigmatic structures that Spanish uses for tense and mood are far more complex than in English, learners of Spanish as a second language are commonly challenged by verb conjugation, especially in the case of irregular verbs.

Paradigms are also a device used in second language learning to lay down a support for understanding the inflectional morphology of the target language. Research holds that L2 students, just like L1, build up their capacity to predict how unfamiliar words inflect or develop another form of it by paying attention to patterns within paradigms. (Milin, (2020).) concentrate on the diachronicity of paradigms between languages, holding that L2 learners can leverage their L1 knowledge with respect to paradigmatic structures to gain new morphological rules in L2. However, they also highlight that, depending on the distance between the two languages' morphological systems, this

transfer process can be problematic, especially when the target language is very different from the source language.

For example, a learner whose first language has relatively simple paradigms might find it difficult to learn a language whose paradigms are more complex, as in Latin or Russian. In contrast, learners whose L1 has complex paradigms are likely to understand the L2 paradigm structure in a similar case. This mechanism of crosslinguistic transfer is important for understanding how learners negotiate the morphological complexity of an L2 (Milin, (2020).)

Cognitive factors also explain how learners acquire and process paradigms. According to Finley (2018), cognitive biases like a preference for regular patterns drive the ability of learners to internalize morphological paradigms. Learners prefer paradigms with regular rules rather than irregular forms. This cognitive bias can account for why learners will find fault in such irregular verbs or nouns that do not follow the paradigmatic standard structure. Both in the L1 and L2 situation, the regularity of a paradigm goes a long way in determining how easy or difficult it is for learners to acquire the morphological rules.

Besides cognitive biases, other linguistic factors, frequency and transparency, also influence how learners internalize paradigms. More frequent forms within a paradigm are learned earlier and more firmly than less frequent forms; more transparent paradigms, where the relationship between base and inflected forms is transparent, are easier in process. This makes it possible to incorporate both cognitive and linguistic factors in explaining how learners acquire and use paradigms in language learning.

Traditionally, one of the most critical means of teaching morphology has been paradigms, especially in inflectional languages. As (Bybee, (1991).)suggested, paradigms, including those derived from the Latin model, have headed most systems' approaches to the teaching and learning of morphology. The paradigm has continuously grouped verb forms under categories like tense, aspect, or mood; that is, paradigms permitted learners to apply rules in inflectional morphology in organizing the numerous templates. They helped in obtaining morphological rules systematically for centuries, especially languages with inflectionally rich systems, as Latin, Greek, or Russian.

(Bybee, (1991).) argues that natural morphology is not just memorization of forms, but rather the connection of learners to the form and meanings in the linguistic system. She maintains that such a natural connection between form and meaning is substantial to the process of language acquisition and manifests in how the learners end up

internalizing paradigms so that they can produce and understand morphologically complex words across different linguistic situations.

Paradigms are central to language acquisition: they provide learners with the structure they need to master inflectional and derivational morphology. Internalizing the relationship between the forms within a paradigm enables learners to predict where unfamiliar forms will go, thus facilitating acquisition of complex grammatical rules. Paradigms are particularly significant for richly inflected languages-the relationships between words within a paradigm are very complex. Research on paradigm acquisition has shown that base forms, cognitive biases, and cross-linguistic transfer all take part in determining the type of shaping learners develop for morphological paradigms. For this reason, it is paradigms that best represent the shaping of morphological acquisition as situated both within first and second language contexts (Blevins, (2016).)

## VIII. Challenges in Acquiring Inflectional Morphology

In many ways, inflectional morphology seems difficult to acquire in most languages, particularly those with rich inflectional systems. (Dressler, (2003).) points out the challenges that are posed both by morphological typology and first language acquisition when learning a language with a more developed morphology. His work on Austrian children learning German shows that some of the earliest morphological production involves overgeneralization mistakes, in which learners apply morphological regularity rules to irregular forms, for example, a learner applying the regular plural morpheme to an irregular noun.

It is perhaps even tougher for second-language learners to learn inflectional morphology when the L2 morphology is fairly different from their L1. (Ionin, (2002).) study how hard children learning English as a second language have it to acquire tense-agreement morphology. They found that, often, children learn tense morphology-for example, the past tense "ed"-before they learn subject-verb agreement-for example, "s" for third person singular. In other words, this pattern shows that it is complex to master morphological rules in a second language especially when the second language is tied to both syntactic and semantic features of the language.

# IX. Morphological Awareness in L1 and L2 Acquisition

One of the crucial abilities in L1 and L2 is morphological awareness that is the ability to reflect on or manipulate morphemes within words. Many studies demonstrated that morphological awareness fosters the development of vocabulary and literacy as learners are able to break down complex words into their constituent morphemes. (Randall, (1982).) suggests that morphological structure is the key for language

آذار ۲۰۲۵

acquisition inasmuch as it enables learners to generalize from specific linguistic instances to broader grammatical rules.

(Lardiere, (2017).)further argues, for example, that morphological awareness is essential for the production of morphologically complex languages in L2 acquisition. For instance, in L2 French acquisition, learners need to acquire the tense-aspect morphology and not only learn to know what those inflectional morphemes look like but also how those functional morphemes work. The results achieved by Lardiere suggest that explicit instruction about morphological rules can facilitate the acquisition of such complex forms, the learners being motivated and encouraged to focus upon formal properties of the language involved.

## X. Conclusion

Morphology is the foundation element in language acquisition with deep impacts how people learn to understand and then generate and use language. It helps a learner grasp the word's structure and prescriptions of complex linguistic expressions' formation. Morphological awareness is as important for first and second language learners as it has significant influences on vocabulary building, reading comprehension, and grammatical accuracy.

Children naturally acquire the rules of first language morphology, eventually knowing how to apply them. It takes time to get them precise enough on how language works. This process tends to include early errors that take the forms of overgeneralizations, but in themselves they have a lot to tell us about how children find their way into using the morphological structures. As developing interlocutors use morphological awareness to break down and learn new word forms, they build their vocabulary and deepen their linguistic competence.

In L2, a learner faces additional challenges, particularly when the target language's morphological system is more complex or different from that of his native language. Acquisition of morphological rules, even more so in languages with rich inflectional systems, usually requires explicit teaching and practice. Even so, it is still possible for the second-language learner to achieve considerable progress toward mastering the language by focusing more intently on morphology and thus better producing and comprehending the language.

Different languages vary with respect to the role of morphology. In some languages, complex morphological systems require learners to be more aware about formation and meaning of words. In others, morphology might take a back seat to syntax, thus having an effect on the strategies by which learners might acquire language. Knowledge of

these differences is important for educators because it enables them to consider the learning strategy to be applied with respect to learner need based on the language being taught.

Implicit morphological instruction should also find a place in language teaching. Learners should, therefore be encouraged to "take the word apart into its constituent morphemes" and practice word formation, and explore word families; educators develop a sense of deconstruction in language structure. This improves linguistic competence while the learner's language use proficiency is enhanced.

Finally, morphology is fundamentally the core of both first and second language acquisition. It shapes learners' understanding and use of language; it remains a framework through which learners can expand their vocabulary, improve their grammatical skills, and gain greater fluency in language use. Through highlighting morphological awareness, teachers can help the learner go through the difficulties of language learning and ensure better language acquisition and learning.
