

## On $(T, L)$ - $\alpha$ - Homotopy and $(T, L)$ - $\alpha$ -Isotopy

Shahba'a M. Yousif

Education College - Al-Mustansirih University

### Abstract:

In this paper we defines the  $(T, L)$ - $\alpha$ - Homotopy, strongly  $(T, L)$ - $\alpha$ -Isotopy and we study the relation among then and  $(T, L)$ - Homotopy, as well as we present the definitions of  $(T, L)$ - $\alpha$ -Isotopy, strongly  $(T, L)$ - $\alpha$ -Isotopy and we study the relation among them and  $(T, L)$ -Isotopy .

### المستخلص :

في البحث الحالي ، عرفنا هومونوبي  $(T, L)$ - $\alpha$  وهومونوبي  $(T, L)$ - $\alpha$  بقوة ، ودرسنا العلاقة بينهم وبين هومونوبي  $(T, L)$  ، بالإضافة إلى ذلك قدمنا تعاريف ايزوتوبي  $(T, L)$ - $\alpha$  وايزونوبي  $(T, L)$ - $\alpha$  بقوة، ودرسنا العلاقة بينهم وبين ايزونوبي  $(T, L)$ .

### Introduction:

In this work we introduce the definition of  $(T, L)$ - $\alpha$ - Homotopy and  $(T, L)$ - $\alpha$ -Isotopy and we study the properties of them. In section two we present the definition of  $(T, L)$ - $\alpha$ - Homotopy and strongly  $(T, L)$ - $\alpha$ -Homotopy and we study the relation among then and  $(T, L)$ -Homotopy. In section three we define  $(T, L)$ - $\alpha$ - deformation and strongly  $(T, L)$ - $\alpha$ - deformation also we study the relation between them and deformation. In section four we give the deformation of  $(T, L)$ - $\alpha$ -construction and strongly  $(T, L)$ - $\alpha$ - construction and we stud some

characters of  $\text{tem}$ . In section five we introduce the definition  $(T, L)$ - $\alpha$ -imbedding and strongly  $(T, L)$ - $\alpha$ -imbedding into the section six.

Where we present the definitions of  $(T, L)$ - $\alpha$ -Isotopy and strongly  $(T, L)$ - $\alpha$ -Isotopy also we study the relation among them and  $(T, L)$ -Isotopy.

In [3] we get the properties of  $\alpha$ -space.

We need the following definitions.

**1.1 Definition:** Let  $(X, \Gamma)$  be a topological space,  $B$  a subset of  $x$  and  $T$  be an operator from  $\Gamma$  into  $P(X)$  i.e  $T: \Gamma \rightarrow P(X)$ . We say that  $T$  is an operator associated with  $\Gamma$  if the following conditions holds.

(O)  $U \subseteq T(u)$  for all  $U \in \Gamma$ . [4]

(S)  $T$  induces an operator  $T_B: \Gamma_B \rightarrow P(B)$ .

such that.  $T_B (U \cap B) = T(u) \cap B$  for every  $u \in \Gamma$  where  $\Gamma_B$  is the relative topology on  $B$ . [5] [6]

**1.2 Definition:** Let  $(X, \Gamma)$  be a topological space and  $T$  be an operator on  $\Gamma$ . A subset  $A$  of  $x$  is said to be  $T$ -open set every  $x \in A$ . There exists an open set  $U$  containing  $x$  such that. A subset  $B$  is said its complement is  $T$ -open [2].

**1.3 Definition:** Let  $(X, \Gamma)$  be a topological space and  $T$  be a mapping from  $\Gamma^\alpha$  into  $P(X)$  i.e  $T: \Gamma^\alpha \rightarrow P(X)$ . then  $T$  is said to be an  $\alpha$ -operator associated with. if the following conditions hold  $U \subseteq T(u)$  for all  $U \in \Gamma$  every, and we say that the  $\alpha$ -operator  $T$  is stable with respect to  $B \in x$  if  $T$  induce and  $\alpha$ - operator  $T_\beta: \Gamma^\alpha \rightarrow P$  such that.  $T_\beta (U \cap B)$  such that.  $T_\beta (U \cap B) = T(u) \cap B$  for every  $u \in \Gamma^\alpha$  where  $\Gamma_\beta^\alpha$  is the relative topology on  $\beta$ . [2]

**1.4 Definition:** Let  $(X, \Gamma)$  be a topological space and  $T$  be an  $\alpha$ -operator  $\Gamma$  A subset  $A$  of  $x$  is said to be  $T$   $\alpha$ -open set if for every  $x \in A$ , there exists an  $\alpha$ -open set  $U$  containing  $x$  such that.  $T(u) \subseteq A$ . [1]

2)  $(T, L)$ - $\alpha$ - Homotopy: in this section we define  $(T, L)$ - $\alpha$ - Homotopy and strongly  $(T, L)$ - $\alpha$ - Homotopy.

**2.1 Definition:** Let  $(X, \Gamma_x)$  be  $T$ - topological space and  $(y, \Gamma_y)$  be  $L$ - topological space. The map  $B: x \times I \rightarrow Y, I = [0,1]$  is said to be a  $(T, L)$ - $\alpha$ - Homotopy between the maps  $f, g: I \rightarrow Y$  iff  $B(X, i), \forall x \in X, i \in I$  is a  $(T, L)$ - $\alpha$ - construction such that  $B(X, 0) = f(X), B(X, 1) = g(X), \forall x \in X$  and  $f, g$  are said to be  $(T, L)$ - $\alpha$ - Homotopic.

**Theorem (1):** Every  $(T, L)$ - Homotopy is  $(T, L)$ - $\alpha$ - Homotopy.

**Proof:** Let  $(X, \Gamma_x)$  be  $T$ - topological space and  $(y, \Gamma_y)$  be  $L$ - topological space.

Let  $B: x \times I \rightarrow Y$  be  $(T, L)$ - Homotopy map between the maps  $f, g: X \rightarrow Y$  that means  $B(X, i), \forall x \in X, i \in I$ , is  $(T, L)$ - $\alpha$ - continuous map

Since [every  $(T, L)$ - continuous map  $(T, L)$ - $\alpha$ - continuous map] [2]

Therefore  $B(X, i), \forall x \in X, i \in I$  is a  $(T, L)$ - $\alpha$ - construction such that  $B(X, 0) = f(X), B(X, 1) = g(X), \forall x \in X$  and  $f, g$  are said to be  $(T, L)$ - $\alpha$ - Homotopy.

**Theorem (2):** The  $(T, L)$ - $\alpha$ - Homotopy relation between maps of  $x$  into  $Y$  is an equivalence relation.

**Proof:** we must prove the  $(T, L)$ - $\alpha$ - Homotopy is reflexive, symmetric and transitive.

- 1- To show  $(T, L)$ - $\alpha$ - Homotopy is reflexive let  $f: x \rightarrow Y$  be map and define a  $(T, L)$ - $\alpha$ - Homotopy  $B: x \times I \rightarrow Y$ , between the  $(T, L)$ - $\alpha$ -

continuous maps  $f, g: X \rightarrow Y$  such that means  $B(X, i) = f(X)$ ,  
 $\forall x \in X, i \in I$  we get  $B(X, 0) = f(X)$  and  $B(X, 1) = f(X)$   
 Thus  $(T, L)$ - $\alpha$ - Homotopy reflexive.

2- To show  $(T, L)$ - $\alpha$ - Homotopy is symmetric let  $f, g: x \rightarrow Y$  such that  
 $f$  is  $(T, L)$ - $\alpha$ - Homotopic to  $g$ .

Then  $\exists B: x \times I \rightarrow Y$  such that  $B(X, 0) = f(X), B(X, 1) = g(X)$ .

We define  $(T, L)$ - $\alpha$ - Homotopy  $k: x \times I \rightarrow Y$

$k(X, i) = B(X, 1-i) \forall x \in X, i \in I$

we get  $k(X, 0) = B(X, 1) = g(X)$

$k(X, 1) = B(X, 0) = f(X)$

then  $g$  is  $(T, L)$ - $\alpha$ - Homotopic to  $f$

thus  $(T, L)$ - $\alpha$ - Homotopy is symmetric

3- To show  $(T, L)$ - $\alpha$ - Homotopy is transitive.

Suppose  $f$  is  $(T, L)$ - $\alpha$ - Homotopic to  $g$ , and  $g$  is  $(T, L)$ - $\alpha$ -  
 Homotopic to  $h$  then there exists  $(T, L)$ - $\alpha$ - Homotopy  $B: x \times I \rightarrow Y$ ,  
 $K: x \times I \rightarrow Y$  such that

$B(X, 0) = f(X), B(X, 1) = g(X), k(X, 0) = g(X), k(X, 1) = h(X)$ .

Now we define  $H: x \times I \rightarrow Y$  such that:

$$H(x, i) = \begin{cases} B(x, 2i), & 0 \leq i \leq 1/2 \\ k(x, 2i - 1), & 1/2 \leq i \leq 1 \end{cases}$$

we get  $H(X, 0) = B(X, 0) = f(X)$

and  $H(X, 1) = K(X, 1) = h(X)$

Therefore  $f$  is  $(T, L)$ - $\alpha$ - Homotopic to  $h$

Hence  $(T, L)$ - $\alpha$ - Homotopy is transitive

Thus  $(T, L)$ - $\alpha$ - Homotopy is an equivalence relation.

**2.2 Definition:** Let  $(X, \Gamma_x)$  be T- topological space and  $(Y, \Gamma_y)$  be L-  $\alpha$ -topological space. The map  $B: X \times I \rightarrow Y, I=[0,1]$  is said to be strongly  $(T, L)$ - $\alpha$ - Homotopy between  $f, g: X \rightarrow Y$  iff  $B(X, i), \forall x \in X, i \in I$  is strongly  $(T, L)$ - $\alpha$ - construction such that  $B(X, 0)=f(X)$  and  $B(X, 1)=g(X), \forall x \in X$ .

**Theorem (3):** Every strongly  $(T, L)$ - Homotopy between maps is  $(T, L)$ - $\alpha$ - Homotopy.

**Proof:** Let  $(X, \Gamma_x)$  be T- $\alpha$ - topological space and  $(Y, \Gamma_y)$  be L-  $\alpha$ - topological space.

Let  $B: X \times I \rightarrow Y$  be strongly  $(T, L)$ -  $\alpha$ - Homotopy, we get  $B(X, i), \forall x \in X$  and  $i \in I$  is strongly  $(T, L)$ - $\alpha$ - continuous.

Since [every strongly  $(T, L)$ -  $\alpha$ -continuous is  $(T, L)$ - $\alpha$ - continuous] [2]

Therefore  $B(X, i), \forall x \in X, i \in I$  is a  $(T, L)$ - $\alpha$ - construction such that  $B(X, 0)=f(X)$  and  $B(X, 1)=g(X), \forall x \in X$  and  $i \in I$ .

**Theorem (4):** Every strongly  $(T, L)$ - Homotopy relation between maps of  $x$  into  $Y$  is an equivalence relation.

**Proof:** Let  $B: X \times I \rightarrow Y$  be strongly  $(T, L)$ -  $\alpha$ - Homotopy, then by theorem (3)  $B$  is  $(T, L)$ - $\alpha$ - Homotopy and by theorem (4) we get the strongly  $(T, L)$ - $\alpha$ - Homotopy is an equivalence relation.

**3)  $(T, L)$ - $\alpha$ - deformation:** in this section we present the definition of  $(T, L)$ - $\alpha$ - deformation and strongly  $(T, L)$ - $\alpha$ - deformation.

**3.1 Definition:** the  $(T, L)$ -  $\alpha$ - Homotopy  $B: X \times I \rightarrow Y$  is said be  $(T, L)$ -  $\alpha$ - deformation, iff  $B(X, 0)$  is inclusion map.

**Theorem (5):** Every  $(T, L)$ - deformation is  $(T, L)$ - $\alpha$ - deformation.

**Proof:** suppose that  $B: X \times I \rightarrow Y$  is Homotopy and  $B(X, 0)$  is inclusion map. Then by theorem (1) we get  $(T, L)$ -  $\alpha$ - Homotopy  $B(X, 0)$  is

inclusion map, then  $B$  is  $(T, L)$ - $\alpha$ - Homotopy and by theorem (4) we get the strongly  $(T, L)$ - $\alpha$ - deformation.

**3.2 Definition:** Let strongly  $(T, L)$ - $\alpha$ - Homotopy  $B: x \times I \rightarrow Y$  is called strongly  $(T, L)$ - $\alpha$ - deformation iff  $B(X, 1)$  is the inclusion map.

**Theorem (6):** Every strongly  $(T, L)$ -  $\alpha$ -deformation is  $(T, L)$ - $\alpha$ -deformation.

*Proof:* suppose that  $B: x \times I \rightarrow Y$  is strongly  $(T, L)$ -  $\alpha$ -deformation.

That is  $B$  strongly  $(T, L)$ - $\alpha$ - Homotopy and  $B(X, 0)$  is inclusion map, and Then by theorem (3) and  $B(X, 0)$  is inclusion map, therefore  $B$  is semi  $\alpha$ - deformation.

**4)  $(T, L)$ - $\alpha$ -construction:** In this section we use section 2 to give the definition of  $(T, L)$ - $\alpha$ - construction and strongly  $(T, L)$ - $\alpha$ - construction we begin by the following definition.

**4.1) Definition:** The  $(T, L)$ -  $\alpha$ - deformation  $B: x \times I \rightarrow Y$  is called  $(T, L)$ - $\alpha$ - construction iff  $B(X, 0)$  is the constant map.

**Theorem (7):** Every  $(T, L)$ -a- construction is  $(T, L)$ - $\alpha$ - construction.

*Proof:* suppose that  $B: x \times I \rightarrow Y$  is  $(T, L)$ - construction .

That mean  $B$  is deformation and  $B(X, 1)$  is constant map,

Then by theorem (5) we get  $B(X, i) \forall x \in X$  and  $i \in I$  is  $(T, L)$ - $\alpha$ -deformation and  $B(X, 1)$  is the constant map.

**4.2) Definition:** The strongly  $(T, L)$ -  $\alpha$ - deformation  $B: x \times I \rightarrow Y$  is called strongly  $(T, L)$ - $\alpha$ - construction iff  $B(X, 1)$  is the constant map.

**Theorem (8):** Every strongly  $(T, L)$ - $\alpha$ -contraction is  $(T, L)$ - $\alpha$ -contraction.

*Proof:* Suppose that  $B: x \times I \rightarrow Y$  is strongly  $(T, L)$ - $\alpha$ -contraction

That mean  $B$  is strongly  $(T, L)$ - $\alpha$ - deformation and  $B(X, 1)$  is constant map, and by theorem (6) we get  $B(X, i) \forall x \in X$  and  $i \in I$  is  $(T, L)$ - $\alpha$ -

deformation and  $B(X, 1)$  is the constant map, therefore  $B$  is  $(T, L)$ - $\alpha$ -construction.

**5)  $(T, L)$ - $\alpha$ -Imbedding:** We present this section in order to present the definition of  $(T, L)$ - $\alpha$ -Isotopy.

**5.1 Definition:** Let  $(X, \Gamma_x)$  be  $T$ -topological space and  $(Y, \Gamma_y)$  be  $L$ -topological space. A one to one map  $f: X \rightarrow Y$  is called  $(T, L)$ - $\alpha$ -Imbedding iff  $\exists$  a  $(T, L)$ - $\alpha$ -Homotopy from  $x$  onto  $f(X)$ .

**Theorem (9):** Every  $(T, L)$ -Imbedding is  $(T, L)$ - $\alpha$ -Imbedding.

**Proof:** Let  $(X, \Gamma_x)$  be  $T$ -topological space and  $(Y, \Gamma_y)$  be  $L$ -topological space. And  $f: X \rightarrow Y$  be  $(T, L)$ - $\alpha$ -Imbedding map.

That mean there exists a  $(T, L)$ -Homeomorphism  $g: X \rightarrow f(X)$  since [every a  $(T, L)$ -Homeomorphism is a  $(T, L)$ - $\alpha$ -Homeomorphism] [2]

Then  $g$  is a  $(T, L)$ - $\alpha$ -Homeomorphism

Hence  $f$  is  $(T, L)$ - $\alpha$ -Imbedding.

**5.2 Definition:** Let  $(X, \Gamma_x)$  be  $T$ -topological space and  $(Y, \Gamma_y)$  be  $L$ -topological space. A one to one map  $f: X \rightarrow Y$  is called strongly  $(T, L)$ - $\alpha$ -Imbedding iff there exists a strongly  $(T, L)$ - $\alpha$ -Homeomorphism from  $x$  onto  $f(X)$ .

**Theorem (10):** Every strongly  $(T, L)$ - $\alpha$ -Imbedding is  $(T, L)$ - $\alpha$ -Imbedding.

**Proof:** Let  $(X, \Gamma_x)$  be  $T$ -topological space and  $(Y, \Gamma_y)$  be  $L$ -topological space respectively, and let  $f: X \rightarrow Y$  be strongly  $(T, L)$ - $\alpha$ -Imbedding.

That is there exists strongly  $(T, L)$ -Homeomorphism  $g: X \rightarrow f(X)$  since [every strongly  $(T, L)$ - $\alpha$ -Homeomorphism is a  $(T, L)$ - $\alpha$ -Homeomorphism] [1], [2]

Thus  $g$  is  $(T, L)$ - $\alpha$ -Homeomorphism

Hence  $f$  is  $(T, L)$ - $\alpha$ -Imbedding.

**6)  $(T, L)$ - $\alpha$ -Isotopy:** In this section we define of  $(T, L)$ - $\alpha$ -Isotopy and strongly  $(T, L)$ - $\alpha$ -Isotopy also we study the relation between them.

**6.1 Definition:** Let  $(X, \Gamma_x)$  and  $(Y, \Gamma_y)$  be two  $T$ - topological and  $L$ - topological spaces respectively.

A map  $f: X \times I \rightarrow Y$ ,  $I=[0,1]$ , is said to be  $(T, L)$ - $\alpha$ -Isotopy between  $f: X \times I \rightarrow Y$  for and and  $i \in I$  is  $(T, L)$ - $\alpha$ -Imbedding such that  $B(X, 0)=f(X)$  and  $B(X, 1)=g(X)$ .

**Theorem (11):** Every  $(T, L)$ -Isotopy is  $(T, L)$ - $\alpha$ -Isotopy.

**Proof:** Let  $(X, \Gamma_x)$  and  $(Y, \Gamma_y)$  be two  $T$ - topological and  $L$ - topological spaces respectively, and let  $B: X \times I \rightarrow Y$  be  $(T, L)$ -Isotopy map between  $f, g: X \rightarrow Y$ .

That mean  $B(X, i)$  for  $x \in X$  and  $i \in I$  is Imbedding map, such that  $B(X, 0)=f(X)$  and  $B(X, 1)=g(X)$ .

Since by theorem (9)  $B(X, i)$  for  $x \in X$  and  $i \in I$  is  $(T, L)$ - $\alpha$ -Imbedding such that

$B(X, 0)=f(X)$  and  $B(X, 1)=g(X)$

Thus  $B(X, i)$  is semi  $\alpha$ -Isotopy.

**Theorem (12):** The  $(T, L)$ - $\alpha$ - Isotopy relation between maps of  $x$  into  $Y$  is an equivalence relation.

**Proof:** We must to prove the  $(T, L)$ - $\alpha$ - Isotopy is reflexive, symmetric and transitive.

first to show  $(T, L)$ - $\alpha$ - Isotopy is reflexive let  $f: X \rightarrow Y$  be map and define a  $B: X \times I \rightarrow Y$  by  $B(X, i)=f(X)$ ,  $\forall x \in X, i \in I$  we get  $(X, 0)=f(X)$  and  $B(X, 1)=g(X)$ .

therefore  $(T, L)$ - $\alpha$ -Isotopy is reflexive.

Neaxt to show  $(T, L)$ - $\alpha$ -Isotopy is symmetric

Let  $B: X \rightarrow Y$  such that  $f$  is  $(T, L)$ - $\alpha$ -Isotopy to  $g$ .

Then there exist  $B: X \times I \rightarrow Y$  such that  $B(X, 0) = f(X)$  and  $B(X, 1) = g(X)$ , we define  $(T, L)$ - $\alpha$ -Isotopy  $K: X \rightarrow Y$  by  $k(X, i) = B(X, i-1) \forall x \in X$  and  $i \in I$  we get  $K(X, 0) = B(X, 1) = g(X)$  and

Then  $g$  is  $(T, L)$ - $\alpha$ -Isotopy to  $f$ .

Thus  $(T, L)$ - $\alpha$ -Isotopy is symmetric

Finally, suppose  $f$  is  $(T, L)$ - $\alpha$ -Isotopy to  $g$  and  $g$  is  $(T, L)$ - $\alpha$ -Isotopy to  $h$ , then there exist  $(T, L)$ - $\alpha$ -Isotopy  $B: X \times I \rightarrow Y$  and  $K: X \rightarrow Y$  such that  $B(X, 0) = f(X)$ ,  $B(X, 1) = g(X)$ ,  $k(X, 0) = g(X)$  and  $k(X, 1) = h(X)$ , we define  $(T, L)$ - $\alpha$ -Isotopy  $H: X \rightarrow Y$  by:

$$H(x, i) = \begin{cases} B(x, 2i), & 0 \leq i \leq 1/2 \\ k(x, 2i - 1), & 1/2 \leq i \leq 1 \end{cases}$$

we get  $H(X, 0) = B(X, 0) = f(X)$

and  $H(X, 1) = K(X, 1) = h(X)$

Therefore  $f$  is  $(T, L)$ - $\alpha$ -Isotopy to  $h$

Thus  $(T, L)$ - $\alpha$ -Isotopy is an equivalence relation.

**6.2 Definition:** Let  $(X, \Gamma_x)$  and  $(Y, \Gamma_y)$   $T$ -topological and  $L$ -topological spaces respectively, a map  $B: X \times I \rightarrow Y$  is said to be strongly  $(T, L)$ - $\alpha$ -Isotopy between  $f, g: X \rightarrow Y$  iff  $B(X, i)$ ,  $\forall x \in X, i \in I$  is strongly  $(T, L)$ - $\alpha$ -Imbedding such that  $B(X, 0) = f(X)$  and  $B(X, 1) = g(X)$ .

**Theorem (13):** Every strongly  $(T, L)$ - $\alpha$ -Isotopy is  $(T, L)$ - $\alpha$ -Isotopy.

**Proof:** Suppose that  $(X, \Gamma_x)$  and  $(Y, \Gamma_y)$  be  $T$ -topological and  $L$ -topological spaces.

Let  $B: X \times I \rightarrow Y$  be strongly  $(T, L)$ - $\alpha$ -Isotopy between  $f, g: X \rightarrow Y$

That means  $B(X, i), \forall x \in X, i \in I$  is strongly  $(T, L)$ - $\alpha$ -Imbedding map such that  $B(X, 0)=f(X)$  and  $B(X, 1)=g(X)$

Since by theorem (10) we get  $B$  is  $(T, L)$ - $\alpha$ -Imbedding such that  $B(X, 0)=f(X)$  and  $B(X, 1)=g(X)$ .

Thus  $B$  is  $(T, L)$ - $\alpha$ -Isotopy.

**Theorem (14):** the strongly  $(T, L)$ - $\alpha$ - Isotopy relation between maps of  $x$  into  $Y$  is an equivalence relation.

***Proof:*** Suppose that  $(X, \Gamma_x)$  and  $(Y, \Gamma_y)$  be  $T$ - topological and  $L$ -topological respectively, and  $B: X \times I \rightarrow Y$  be strongly  $(T, L)$ - $\alpha$ - Isotopy since by theorem (12) we get  $B$  is  $(T, L)$ - $\alpha$ -Imbedding and by theorem (13) we get require result.
