### Abstract

The main object of this work is to calculate the graded characters of classical groups  $A_n, C_n, D_n$  by using the basic spin characters .

### الخلاصة

الهدف الأساسي لهذا البحث هو حساب الشخصوس المتدرجة العقديّة للزمر الكلاسيكية من النوع  $A_n, C_n$  و  $D_n$ .

### 1. Introduction

Let  $V$  be an  $n$  dimensional real Euclidean space with inner product  $\langle, \rangle$ .

For each  $r \in V, r \neq 0$ , let  $\omega_r$  be the reflection in the hyperplane orthogonal to  $r$ , i.e. if

$$\omega_r(x) = x - \frac{2 \langle r, x \rangle}{\langle r, r \rangle} r.$$

In [5] Morris define the Weyl group  $W=W(\Phi)$  is the group generated by the reflections  $\omega_r, r \in \Phi$ , where  $\Phi$  is a finite subset of  $V$  which spans  $V$  such that  $\Phi$  is the root system of a simple Lie algebra, and he classified  $W$  into two kinds, the first kind is called the classical

types which contain the types  $A_n, B_n, C_n$  and  $D_n$ . The second kind is called the exceptional Weyl groups which contain the type  $E_n$  ( $n=6,7,8$ ),  $F_4$  and  $G_2$ , and he studied their basic Spin characters.

In this paper we calculate explicitly the graded character of the Weyl groups of the type  $A_n$  ( $n \geq 1$ ),  $C_n$  ( $n \geq 3$ ) and  $D_n$  ( $n \geq 4$ ), by using their basic Spin characters which are called the Classical groups.

### 2. On The Graded Character

In this section we give the definition of the graded character of the orthogonal group and calculate explicitly the graded characters by using its basic spin characters.

**Definition (2.1)** [1] : Let  $V$  be an  $n$ -dimensional real Euclidean space with inner product  $\langle, \rangle$ , and  $O(V)$  be the group of orthogonal linear transformation of  $V$ , A subset  $\Phi$  of  $V$  is called a root system in  $V$  if it satisfies the following conditions :

- i-  $\Phi$  is a finite set of non zero vectors, and  $\Phi$  generates (spans)  $V$ .
- ii- If  $r \in \Phi$ , then  $\tau_r(\Phi) = \Phi$ , where  $\tau_r$  is an orthogonal map  $\tau_r \in O(V)$ .
- iii- If  $r, s \in \Phi$ , then  $\frac{2\langle r, s \rangle}{\langle r, r \rangle} \in \mathbb{Z}$ .
- iv- If  $r, \lambda r \in \Phi$ , and  $\lambda \in \mathbb{R}$  (real number), then  $\lambda = \pm 1$ .

Also the dimension of  $V$  is called the rank of the root system.

**Definition (2.2)** [5] : Let  $\Phi$  be a root system in  $V$ , then the Weyl group of  $\Phi$  which denoted by  $W(\Phi)$  is the group generated by the reflection  $\tau_r, r \in \Phi$ .

We note that  $W(\Phi)$  is a subgroup of  $O(V)$ .

**Definition (2.3)** [1] : Let  $O(n)$  be an orthogonal group of all  $n \times n$  orthogonal matrices ,if  $\tau \in O(n)$  then the basic Spin representation of  $O(n)$  is defined as follows :

$$\bar{P}(\tau) = P(\tilde{P}^{-1}(\tau)),$$

$$\bar{P}'(\tau) = P'(\tilde{P}'^{-1}(\tau)),$$

Where  $P$  and  $P'$  are the representation of the Clifford algebra [1] .

In particular, if  $u = \sum_{i=1}^n \alpha_i e_i \in V$  ,and  $\tau_u$  is the corresponding reflection in  $O(n)$  ,then :

$$\bar{P}(\tau_u) = P(\tilde{P}^{-1}(\tau_u)) = P\left(\sum_{i=1}^n \alpha_i e_i\right) = \sum_{i=1}^n \alpha_i M_i,$$

$$\text{Similariy } \bar{P}'(\tau_u) = \sum_{i=1}^n \alpha_i M'_i,$$

where  $M_i$  and  $M'_i$  ( $i=1, \dots, n$ ) are defined in [4].then the representations  $\bar{P}$  and  $\bar{P}'$  are the basic spin representation of  $O(n)$  of the degree  $2^{n/2}$  ,and we compute its value by the following theorem .

**Theorem (2.1)** [4]:Let  $\bar{P}$  and  $\bar{P}'$  are the basic spin representation of the representation  $P$  and  $P'$  respectively ,then :

$$i - \bar{P}(\tau_1) = \bar{P}(\tau_2) = \begin{bmatrix} e^{\frac{1}{2}i\theta_1} & 0 \\ 0 & e^{-\frac{1}{2}i\theta_1} \end{bmatrix} \otimes \dots \otimes \begin{bmatrix} e^{\frac{1}{2}i\theta_n} & 0 \\ 0 & e^{-\frac{1}{2}i\theta_n} \end{bmatrix},$$

$$ii - \bar{P}(\tau_3) = \begin{bmatrix} 0 & i \\ -i & 0 \end{bmatrix} \otimes \begin{bmatrix} e^{\frac{1}{2}i\theta_2} & 0 \\ 0 & e^{-\frac{1}{2}i\theta_2} \end{bmatrix} \otimes \dots \otimes \begin{bmatrix} e^{\frac{1}{2}i\theta_n} & 0 \\ 0 & e^{-\frac{1}{2}i\theta_n} \end{bmatrix},$$

$$iii - \bar{P}(\tau_4) = \begin{bmatrix} e^{\frac{1}{2}i\theta_1} & 0 \\ 0 & -e^{-\frac{1}{2}i\theta_1} \end{bmatrix} \otimes \dots \otimes \begin{bmatrix} e^{\frac{1}{2}i\theta_n} & 0 \\ 0 & -e^{-\frac{1}{2}i\theta_n} \end{bmatrix},$$

$$iv - \bar{P}'(\tau_1) = \bar{P}'(\tau_2) = \begin{bmatrix} e^{-\frac{1}{2}i\theta_1} & 0 \\ 0 & e^{\frac{1}{2}i\theta_1} \end{bmatrix} \otimes \dots \otimes \begin{bmatrix} e^{-\frac{1}{2}i\theta_n} & 0 \\ 0 & e^{\frac{1}{2}i\theta_n} \end{bmatrix},$$

$$v - \bar{P}'(\tau_3) = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix} \otimes \begin{bmatrix} e^{-\frac{1}{2}i\theta_2} & 0 \\ 0 & e^{\frac{1}{2}i\theta_2} \end{bmatrix} \otimes \dots \otimes \begin{bmatrix} e^{-\frac{1}{2}i\theta_n} & 0 \\ 0 & e^{\frac{1}{2}i\theta_n} \end{bmatrix},$$

$$vi - \bar{P}'(\tau_4) = i \begin{bmatrix} e^{-\frac{1}{2}i\theta_1} & 0 \\ 0 & -e^{\frac{1}{2}i\theta_1} \end{bmatrix} \otimes \dots \otimes \begin{bmatrix} e^{-\frac{1}{2}i\theta_n} & 0 \\ 0 & -e^{\frac{1}{2}i\theta_n} \end{bmatrix}.$$

Now we can obtain the basic spin characters by the following corollary.

**Corollary (2.2)** : Let  $\bar{\chi}$  and  $\bar{\chi}'$  be denote the characters of  $\bar{P}$  and  $\bar{P}'$  respectively ,then :

$$i - \bar{\chi}(\tau_1) = \bar{\chi}(\tau_2) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j ,$$

$$ii - \bar{\chi}(\tau_3) = 0 ,$$

$$iii - \bar{\chi}(\tau_4) = i^v \prod_{j=1}^v 2 \sin \frac{1}{2} \theta_j ,$$

$$iv - \bar{\chi}'(\tau_1) = \bar{\chi}'(\tau_2) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j ,$$

$$v - \bar{\chi}'(\tau_3) = 0 ,$$

$$vi - \bar{\chi}'(\tau_4) = i^{v+1} \prod_{j=1}^v 2 \sin \frac{1}{2} \theta_j .$$

Now, we can see the following lemma and the two definitions in [3] .

**Lemma (2.3)** : Let  $SO(n)$  be the set of all the special orthogonal matrices forms a subgroup of  $O(n)$  ,then :

- i- If  $\tau \in SO(n)$  then  $\bar{\chi}(\tau) \neq 0$  and  $\bar{\chi}'(\tau) \neq 0$  iff -1 is not an eigen value of  $\tau$  .
- ii- If  $\tau \in O(n) \setminus SO(n)$  then  $\bar{\chi}(\tau) \neq 0$  and  $\bar{\chi}'(\tau) \neq 0$  iff 1 is not an eigen value of  $\tau$  .

**Definition (2.4)** : Let  $H \leq G$  be a finite group such that  $[G:H]=2$  and  $T$  be irreducible projective representation of  $G$  then  $T$  is said to be split in  $H$  if  $T = T_1 \oplus T_2$  on  $H$  ,where  $T_1$  and  $T_2$  are irreducible projective representation of  $H$  .

**Definition (2.5)** : Let  $[G:H]=2$  and an irreducible projective representation  $P$  of  $G$  split in  $H$ , then

$$\tilde{P}(g) \cong (-1)^{v(g)} P(g), \forall g \in G \text{ where}$$

$$v(g) = \begin{cases} 0 & \text{if } g \in H \\ 1 & \text{other wise} \end{cases}, \text{ is called the projective representation associate to } P.$$

Thus, if  $\bar{\chi}$  is the character of  $P$  and  $\delta$  is the character of  $\tilde{P}$  then  $\delta$  is an associate character to  $\bar{\chi}$ .

**Theorem (2.4)** : Let  $\bar{\chi}$  and  $\bar{\chi}'$  are the basic spin characters of  $\bar{P}$  and  $\bar{P}'$  respectively, and let  $\delta$  and  $\delta'$  denote the associate character to  $\bar{\chi}$  and  $\bar{\chi}'$  respectively, then :

$$i - \delta(\tau_1) = \delta(\tau_2) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j,$$

$$ii - \delta(\tau_3) = 0,$$

$$iii - \delta(\tau_4) = -i^v \prod_{j=1}^v 2 \sin \frac{1}{2} \theta_j,$$

$$iv - \delta'(\tau_1) = \delta'(\tau_2) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j,$$

$$v - \delta'(\tau_3) = 0,$$

$$vi - \delta'(\tau_4) = -i^{v+1} \prod_{j=1}^v 2 \sin \frac{1}{2} \theta_j.$$

**Proof:** By def.2.5. ,  $\tilde{P}(\tau_1) \cong (-1)^{v(\tau_1)} \bar{P}(\tau_1)$ , since  $\det(\tau_1)=1$  then  $\tau_1 \in SO(n)$ , thus  $v(\tau_1)=0$ , hence  $\tilde{P}(\tau_1) \cong \bar{P}(\tau_1)$ , but  $\text{trace}(\tilde{P}(\tau_1)) = \text{trace}(\bar{P}(\tau_1))$ , then

$$\delta(\tau_1) = \bar{\chi}(\tau_1) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j, \text{ hence } \delta(\tau_1) = \delta(\tau_2) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j.$$

To prove  $\delta(\tau_3) = 0$  , by def.2.5. ,  $\tilde{P}(\tau_3) \cong (-1)^{v(\tau_3)} \bar{P}(\tau_3)$  , since  $\det(\tau_3) = -1$  , then  $\tau_3 \in O(n)/SO(n)$ , thus  $v(\tau_3) = 1$  , hence  $\tilde{P}(\tau_3) \cong -\bar{P}(\tau_3)$  , but  $trace(\tilde{P}(\tau_3)) = -trace(\bar{P}(\tau_3))$  , then  $\delta(\tau_3) = -\bar{\chi}(\tau_3) = 0$ , since  $\bar{\chi}(\tau_3) = 0$ .

Also, since  $\det(\tau_4) = -1$  , then  $v(\tau_4) = 1$  , hence  $\tilde{P}(\tau_4) \cong -\bar{P}(\tau_4)$  , but  $trace(\tilde{P}(\tau_4)) = -trace(\bar{P}(\tau_4))$  , then  $\delta(\tau_4) = -\bar{\chi}(\tau_4) = -i^v \prod_{j=1}^v 2 \sin \frac{1}{2} \theta_j$  .

Similarly of (iv),(v) and (vi) .

**Definition (2.6)** [4]: Let  $\bar{\chi}$  be the basic spin character ,and  $\delta$  be an associate character to  $\bar{\chi}$  ,then for all  $\tau \in O(n)$ ,we define a graded character  $\chi(\tau)$  by

$$\chi(\tau) = \begin{cases} \bar{\chi}(\tau) & \text{if } n \text{ is even} \\ \bar{\chi}(\tau) + \delta(\tau) & \text{if } n \text{ is odd} \end{cases}$$

**Theorem (2.5)** : Let  $\chi$  and  $\chi'$  be the graded characters of  $\bar{P}$  and  $\bar{P}'$  respectively ,then :

$$i - \chi(\tau_1) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j ,$$

$$ii - \chi(\tau_2) = 2 \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j ,$$

$$iii - \chi(\tau_3) = \chi(\tau_4) = 0 ,$$

$$iv - \chi'(\tau_1) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j ,$$

$$v - \chi'(\tau_2) = 2 \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j ,$$

$$vi - \chi'(\tau_3) = \chi'(\tau_4) = 0 .$$

**Proof** : By cor.(2.2) ,we get :

$$\bar{\chi}(\tau_1) = \bar{\chi}(\tau_2) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j, \text{ and } \delta(\tau_1) = \delta(\tau_2) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j, \text{ by th.(2.3) ,and if}$$

n is even ,then  $\chi(\tau_1) = \bar{\chi}(\tau_1) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j$  ,and if n is odd ,then

$$\chi(\tau_2) = \bar{\chi}(\tau_2) + \delta(\tau_2) = \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j + \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j = 2 \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j.$$

Now, since  $\bar{\chi}(\tau_3) = 0$  by cor.(2.2) ,then  $\chi(\tau_3) = 0$  .

And, since  $\bar{\chi}(\tau_4) = i^v \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j$  ,and  $\delta(\tau_4) = -i^v \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j$  by theorem.(2.4) ,and if n is odd ,then

$$\chi(\tau_4) = \bar{\chi}(\tau_4) + \delta(\tau_4) = i^v \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j - i^v \prod_{j=1}^v 2 \cos \frac{1}{2} \theta_j = 0.$$

Similarly of (iv) ,(v) and (vi) .

### 3. The Classical Group $A_n$ , when $n \geq 1$

In this section we shall calculated the value of the graded character of  $W(A_n)$  ,when  $n \geq 1$  by using the proof of theorem (3.1) .

We note that  $W(A_n)$  is the Symmetric group  $S_{n+1}$  of the degree  $n+1$  ,and the conjugacy classes are parameterized by the partition  $(\lambda_1, \lambda_2, \dots, \lambda_s)$  of  $n+1$  or by Carter diagrams of the form  $A_{i_1} + A_{i_2} + \dots + A_{i_k}$  ,where  $\sum_{r=1}^k (i_r + 1) = n+1$ , [2 ] .

**Theorem (3.1):** If  $\bar{\chi}$  is the basic spin character of  $W(A_n)$  ,then:

$$\bar{\chi}(\sigma) = \left\{ \begin{array}{ll} 2^{(k-1)/2} & \text{if } \sigma \in A_{i_1} + A_{i_2} + \dots + A_{i_k} \\ & \text{where } i_r, r = 1, \dots, k \text{ are all even} \\ i^{(n-1)/2} \sqrt{(n+1)/2} & \text{if } \sigma \in A_n, n \text{ is odd} \\ 0 & \text{if } \sigma \in W(A_n) \end{array} \right. .$$

**Proof :** If  $\sigma \in (1)$ , then the characteristic polynomial of  $\sigma$  is  $(1-t)^{-1} \prod_{r=1}^k (1-t^{i_r+1})$ , and the eigenvalues of  $\sigma$  are the  $(i_r+1)$ th roots of unity ( $r=1, \dots, k$ ) without 1 deleted, and  $\bar{\chi}$  is the character of the basic spin representation,  $\bar{\chi} \neq 0$  iff  $\sigma \in (1)$ , where all the  $i_r$ s are even, or  $\sigma \in A_n$ ,  $n$  is odd.

Note that if  $n$  is even, then  $k$  is odd, and if  $n$  is odd, then  $k$  is even.

Now, if  $\sigma \in W(A_n)$  we calculate the value of  $\bar{\chi}$  of  $\sigma$ :

- i) If  $\sigma \in (1)$ , where all the  $i_r$ s are even then  $\sigma$  is of type  $\tau_2$ ,  $\tau_2$  is the canonical of  $O(n)$ , then by cor.(2.2) we have

$$\begin{aligned} \bar{\chi}(\sigma) &= 2^{k-1/2} \left( \prod_{r=1}^{i_1/2} 2 \cos \frac{r_1 \pi}{i_1+1} \right) \dots \left( \prod_{r=1}^{i_k/2} 2 \cos \frac{r_k \pi}{i_k+1} \right) \\ &= 2^{k-1/2} \prod_{s=1}^k \prod_{r_s}^{i_s/2} 2 \cos \frac{r_s \pi}{i_s+1} \\ &= 2^{k-1/2} . \end{aligned}$$

- ii) If  $n$  is odd,  $\sigma \in A_n$ , then by cor.(2.2):

$$\begin{aligned} \bar{\chi}(\sigma) &= i^{n-1/2} \left( \prod_{r=1}^{n-1/2} 2 \sin \frac{r_k \pi}{n+1} \right) \\ &= 2^{n-1/2} \sqrt{n+1/2} . \end{aligned}$$

**Theorem (3.2)** : If  $\chi$  is the graded character of  $W(A_n)$  and if  $\sigma = A_{i_1} + A_{i_2} + \dots + A_{i_k}$  (1) where  $1 \leq i_1 < i_2 < \dots < i_k \leq n$  are all even, then :

$$\chi(\sigma) = \begin{cases} 2^{n-k/2} & \text{if } k \text{ is odd (n is even)} \\ 2^{(n-k)/2} & \text{if } k \text{ is even (n is odd)} \\ 0 & \text{for all other } \sigma \in W(A_n) \end{cases}$$

**Proof** : If  $\sigma \in (1)$ , where all the  $i_s$  are even that is  $A_{i_s}$  corresponds to a cycle of the length  $(i_s+1)$ , then  $A_{i_s}$  corresponds to even cycles, then  $\delta(\sigma) = \bar{\chi}(\sigma) = 2^{k/2}$ , for all  $\sigma \in (1)$ .

Now,

- i) If  $k$  is odd  $n$  is even, then by (th.3.1),  $\chi(\sigma) = \bar{\chi}(\sigma) = 2^{k/2}$ .
- ii) If  $k$  is even,  $n$  is odd, then by (th.3.1),  $\chi(\sigma) = \delta(\sigma) + \bar{\chi}(\sigma)$   
 $= 2^{k/2} + 2^{k/2} = 2 \cdot 2^{k/2} = 2^{k+1/2}$ .

- iii) if  $\sigma \in A_n$ ,  $n$  is odd, then  $A_n$  corresponds to a cycle of the length  $(n+1)$ , i.e  $A_n$  corresponds to an odd cycle.

Thus the associate character of the class  $A_n$ ,  $n$  is odd is  $\delta(\sigma) = -\bar{\chi}(\sigma) = -i^{n/2} \sqrt{\frac{n+1}{2}}$ , then by (th.3.1)

$$\chi(\sigma) = \delta(\sigma) + \bar{\chi}(\sigma) = -i^{n/2} \sqrt{\frac{n+1}{2}} + i^{n/2} \sqrt{\frac{n+1}{2}} = 0.$$

And for all other  $\sigma \in W(A_n)$ ,  $\bar{\chi}(\sigma) = 0$ , hence  $\chi(\sigma) = 0$ .

**4. The Classical Group  $C_n$ , when  $n \geq 3$**

The conjugacy classes of  $W(C_n)$  are in a one-to-one correspondence with admissible diagrams [2 ] of the form  $A_{i_1}+A_{i_2}+\dots+A_{i_r} \quad C_{j_1}+C_{j_2}+\dots+C_{j_s}$  where  $\sum_{k=1}^r (i_k + 1) + \sum_{k=1}^s j_k = n$ , or equivalently to pairs of partition  $(\lambda, \mu)$ , where  $\lambda = i_1+1, \dots, i_r+1$  ,  $\mu = j_1, \dots, j_s$ .

In this section we calculate the value of the graded character of  $C_n$  depended on the following theorem.

**Theorem (4.1):** If  $\bar{\chi}$  is the basic spin character of  $W(C_n)$  ,then:

1- If  $\sigma \in A_{i_1}+A_{i_2}+\dots+A_{i_r} \quad C_{j_1}+C_{j_2}+\dots+C_{j_s} \quad \dots (2)$  ,where  $i_1, \dots, i_r$  ,  $j_1, \dots, j_s$  are all even ,then

$$\bar{\chi}(\sigma) = \left\{ \begin{array}{ll} 2^{1/2} & \text{if } n \text{ is even,} \\ 2^{t-1/2} & \text{if } n \text{ is odd , } t = r + s \text{ is the number} \\ & \text{of parts in the partition of } n \end{array} \right\} .$$

2- If  $\sigma \in C_{j_1}+C_{j_2}+\dots+C_{j_s} \quad \dots (3)$  ,then

$$\bar{\chi}(\sigma) = \left\{ \begin{array}{ll} i^{(n-1)/2} 2^{(s-1)/2} & \text{if } n \text{ is even ,} \\ 0 & \text{for all other } \sigma \in W(C_n) \end{array} \right\} .$$

**Proof :** If  $\sigma \in (2)$ , then the characteristic polynomial of  $\sigma$  is  $\prod_{k=1}^r (1-t^{i_k+1}) \prod_{k=1}^s (1+t^{j_k})$ , and the eigenvalues of an element in this class are  $(t_k+1)$  the roots of unity ( $k=1, \dots, r$ ) and the  $j_k 2^{j_k}$  the roots of unity which are not  $j_k$  the roots of unity ( $k=1, \dots, s$ ).

If  $\bar{\chi}$  is the basic spin character, then by lemma(2.3)

$\bar{\chi} \neq 0$  iff  $\sigma \in (2)$ , where  $i_1, \dots, i_r, j_1, \dots, j_s$  are all even,  
or  $\sigma \in (3)$ , when  $n$  is odd.

Now, we calculate the value of  $\bar{\chi}$  of  $\sigma$  :

1- If  $\sigma \in (2)$ , then by cor.(2.2) we have

$$\begin{aligned} \bar{\chi}(\sigma) &= 2^{r/2} \left( \prod_{k=1}^r \left( \prod_{r_k=1}^{i_k/2} 2 \cos \frac{r_k \pi}{j_k + 1} \right) \right) \prod_{k=1}^s \left( \left( \prod_{r_k=1}^{j_k-1} 2 \cos \frac{r_s \pi}{2j_k} \right) \left( \prod_{r_k=1}^{i_k/2} 2 \cos \frac{r_k \pi}{j_k} \right)^{-1} \right) \\ &= 2^{r/2} \prod_{k=1}^s \left( \sqrt{j_k} \left( \sqrt{j_k/2} \right)^{-1} \right) = 2^{r/2} \cdot 2^{s/2} . \end{aligned}$$

$$\text{Hence, } \bar{\chi}(\sigma) = \left. \begin{cases} 2^{1/2} & \text{if } n \text{ is even,} \\ 2^{t-1/2} & \text{if } n \text{ is odd, } t = r + s \end{cases} \right\} .$$

2- If  $\sigma \in (3)$ , let  $p$  be the number of  $j_k$  which are odd, then by cor.(2.2) :

$$\begin{aligned} \bar{\chi}(\sigma) &= 2^{p-1/2} \left( \prod_{k=1}^p \left( \prod_{r_k=1}^{i_k-1/2} 2 \cos \frac{r_k \pi}{j_k} \right) \right) \prod_{k=p+1}^s \left( \left( \prod_{r_k=1}^{j_k-1} 2 \sin \frac{r_s \pi}{2j_k} \right) \left( \prod_{r_k=p+1}^{i_k-1/2} 2 \sin \frac{r_k \pi}{j_k} \right)^{-1} \right) \\ &= 2^{p-1/2} j^{n-1/2} \prod_{k=p+1}^s \left( \sqrt{j_k} \left( \sqrt{j_k/2} \right)^{-1} \right) = j^{n-1/2} \cdot 2^{p-1/2} \cdot 2^{s-p/2} = i^{n-1} \cdot 2^{s-1/2} . \end{aligned}$$

**Theorem (4.2)** : If  $\chi$  is the graded character of  $W(C_n)$ , then :

1- If  $\sigma \in A_{i_1} + A_{i_2} + \dots + A_{i_r} + C_{j_1} + C_{j_2} + \dots + C_{j_s} \dots (2)$ , where  $i_1, \dots, i_r, j_1, \dots, j_s$  are all even, then

$$\chi(\sigma) = \left\{ \begin{array}{ll} 2^{1/2} & \text{if } n \text{ is even,} \\ 2^{t+1/2} & \text{if } n \text{ is odd, } s \text{ is odd} \\ 0 & \text{if } n \text{ is odd, } s \text{ is odd, } t = r + s \end{array} \right\} .$$

2- If  $\sigma \in C_{j_1} + C_{j_2} + \dots + C_{j_s} \dots (3)$ ,  $n$  is odd, then

$$\chi(\sigma) = \left\{ \begin{array}{ll} i^{(n-1)/2} 2^{s+1} & \text{if } p \text{ is even,} \\ 0 & \text{if } p \text{ is odd,} \\ 0 & \text{for all other } \sigma \in W(C_n) \end{array} \right\} . \text{ where } p \text{ is the number of } j_k$$

which are odd .

**Proof:**

1- If  $\sigma \in (2)$ , where all the  $i_k$ s and  $j_m$ s are even that is  $A_{i_k}$  corresponds to odd cycles, and  $C_{j_m}$  corresponds to acycle of the length  $j_m$ , then  $C_{j_m}, m=1, \dots, s$  corresponds to odd cycle, thus (2) is an even class if  $s$  is even, and (2) is an odd class if  $s$  is odd, then

$$\delta(\sigma) = \left\{ \begin{array}{ll} \bar{\chi}(\sigma) & \text{if } s \text{ is even,} \\ -\bar{\chi}(\sigma) & \text{if } s \text{ is odd} \end{array} \right\} .$$

Now if  $n$  is even, then we have  $\chi(\sigma) = \bar{\chi}(\sigma)$  and  $\chi(\sigma) = 2^{1/2}$ , by th.(4.1), and if  $n$  is odd, then by th.(4,1) :

$$\chi(\sigma) = \begin{cases} 2^{s+1/2} & \text{if } s \text{ is even,} \\ 0 & \text{if } s \text{ is odd} \end{cases} .$$

2- If  $\sigma \in (3)$ , and  $n$  is odd, then if  $p$  is the number of  $j_k$  which are odd, we get

$$\chi(\sigma) = \begin{cases} i^{(s-1)/2} & \text{if } p \text{ is even,} \\ -i^{(s-1)/2} & \text{if } p \text{ is odd,} \end{cases} .$$

Thus if  $p$  is even, then by th.(4.1) :

$$\begin{aligned} \chi(\sigma) &= i^{n-1/2} 2^{s-1/2} + i^{n-1/2} 2^{s-1/2} \\ &= 2i^{n-1/2} 2^{s-1/2} = i^{n-1/2} 2^{s+1/2}, \end{aligned}$$

And if  $p$  is odd,  $\chi(\sigma) = -i^{n-1/2} 2^{s-1/2} + i^{n-1/2} 2^{s-1/2} = 0$ ,

Hence,

$$\chi(\sigma) = \begin{cases} i^{(n-1)/2} 2^{s+1/2} & \text{if } p \text{ is even,} \\ 0 & \text{if } p \text{ is odd,} \end{cases} .$$

And for all other  $\sigma \in W(C_n)$ ,  $\bar{\chi}(\sigma) = 0$ , then  $\chi(\sigma) = 0$ .

### 5. The Classical Group $D_n$ , when $n \geq 4$

The conjugacy classes are parameterized by certain admissible diagrams [2] of the form  $Ai_1 + Ai_2 + \dots + Ai_r + Dj_1(a_{k_1}) + \dots + Dj_s(a_{k_s})$  where  $\sum_{k=1}^r (i_k + 1) + \sum_{k=1}^s j_k = n$ , and for convenience we have put  $D_j = D_j(a_0)$ ,  $0 \leq k_i \leq (j_i/2) - 1$ .

Furthermore, there are two conjugacy classes when  $i_k$  ( $k=1, 2, \dots, r$ ) are all odd and  $j_k = 0$ ,  $k=(1, \dots, s)$ .

In this section we calculated the value of the graded character of  $D_n$ .

**Theorem (5.1):** If  $\bar{\chi}$  is the basic spin character of  $W(D_n)$ , then:

1- If  $\sigma \in Ai_1 + Ai_2 + \dots + Ai_r + Dj_1(a_{k_1}) + \dots + Dj_s(a_{k_s}) \dots$  (4), where  $i_1, \dots, i_r, j_1, \dots, j_s$  are all even, and  $k_1, \dots, k_s$  are all odd, then :

$$\bar{\chi}(\sigma) = \left\{ \begin{array}{ll} 2^{t+\frac{1}{2}} & \text{if } n \text{ is even,} \\ 2^{t+s-\frac{1}{2}} & \text{if } n \text{ is odd, } t = r + s \end{array} \right\} .$$

2- If  $\sigma \in Dj_1(a_{k_1}) + \dots + Dj_s(a_{k_s}) \dots$  (5), then

$$\bar{\chi}(\sigma) = \left\{ \begin{array}{ll} i^{(n-1)/2} 2^{(s-1)/2} & \text{if } n \text{ is odd,} \\ 0 & \text{for all other } \sigma \in W(D_n) \end{array} \right\} .$$

**Proof :** If  $\sigma \in W(D_n)$ , then the characteristic polynomial of  $\sigma$  is

$$\prod_{p=1}^r (1 - t^{i_p+1}) \prod_{p=1}^s (1 + t^{j_k - k_p - 1}) \prod_{p=1}^s (1 + t^{k_p+1}) ,$$

If  $\bar{\chi}$  is the basic spin character, then by lemma(2.3)

$\bar{\chi} \neq 0$  iff

i-  $\sigma \in (4)$ , where  $i_1, \dots, i_r, j_1, \dots, j_s$  are all even, and  $k_1, \dots, k_s$  are all odd

ii-  $\sigma \in (5)$ , when  $n$  is odd, and  $s$  also odd.

Now, we calculate the value of  $\bar{\chi}$  of  $\sigma$  :

1- If  $\sigma \in (4)$ , then by th.(4.1), [6], and cor.(2.2) we have :

$$\begin{aligned} \bar{\chi}(\sigma) &= 2^{r/2} \left( \prod_{i=1}^r \left( \prod_{r_i=1}^{j_i/2} 2 \cos \frac{r_i \pi}{j_i + 1} \right) \right) \prod_{i=1}^s \left( \left( \prod_{r_i=1}^{k_i-1} 2 \cos \frac{r_i \pi}{2l_k} \right) \left( \prod_{r_i=1}^{j_i/2} 2 \cos \frac{r_i \pi}{k_i} \right)^{-1} \right) \\ &\left( \prod_{r_i=1}^{j_i-k_i-2} 2 \cos \frac{r_i \pi}{j_i + 1} \right) \left( \prod_{r_i=1}^{j_i/2-k_i/2-1} 2 \cos \frac{r_i \pi}{j_i - k_i - 1} \right)^{-1} \quad \text{Hen} \\ &= 2^{r/2} \prod_{i=1}^s (\sqrt{k_i} (\sqrt{k_i/2})^{-1} (\sqrt{j_i - k_i - 1}) (\sqrt{j_i - k_i - 1/2})^{-1}) = 2^{r/2} \cdot 2^s \end{aligned}$$

$$\text{ce, } \bar{\chi}(\sigma) = \begin{cases} 2^{t+s/2} & \text{if } n \text{ is even,} \\ 2^{t+s-1/2} & \text{if } n \text{ is odd, } t=r+s \end{cases}$$

2- If  $\sigma \in (5)$ , and  $n$  is odd, then if  $p$  is the number of the  $j_k$ , then by cor.(2.2), and [6], we have :

$$\begin{aligned} \bar{\chi}(\sigma) &= i^{n-1} 2^{p-1/2} \left( \prod_{i=1}^p \left( \prod_{r_i=1}^{j_i-1/2-k_i-1/2} 2 \cos \frac{r_i \pi}{j_i - k_i - 1} \right) \left( \prod_{r_i=1}^{k_i-1} 2 \sin \frac{k_i \pi}{2k_i} \right) \left( \prod_{r_i=1}^{j_i/2-1} 2 \cos \frac{k_i \pi}{k_i} \right)^{-1} \right) \\ &\prod_{i=p+1}^s \left( \prod_{r_i=1}^{k_i-1} 2 \cos \frac{r_i \pi}{2k_i} \right) \left( \prod_{r_i=1}^{j_i/2-1} 2 \cos \frac{r_i \pi}{2k_i} \right)^{-1} \left( \prod_{r_i=1}^{j_i-k_i-2} 2 \cos \frac{r_i \pi}{2(j_i k_i - 1)} \right) \left( \prod_{r_i=1}^{j_i/2-k_i/2-1} 2 \cos \frac{r_i \pi}{j_i - k_i - 1} \right)^{-1} \\ &= i^{n-1/2} 2^{p/2} 2^{p-1/2} 2^{s-p} = i^{n-1/2} \cdot 2^{s-1/2} \end{aligned}$$

And for all other  $\sigma \in W(D_n)$ ,  $\bar{\chi}(\sigma) \neq 0$ .

**Theorem (5.2)** : If  $\chi$  is the graded character of  $W(D_n)$ , then :

1- If  $\sigma \in A_{i_1} + A_{i_2} + \dots + A_{i_r} + D_{j_1}(a_{k_1}) + \dots + D_{j_s}(a_{k_s}) \dots$  (4), where  $i_1, \dots, i_r, j_1, \dots, j_s$  are all even, and  $k_1, \dots, k_s$  are all odd, then

$$\chi(\sigma) = \left\{ \begin{array}{ll} 2^{t+s} & \text{if } n \text{ is even,} \\ 2^{t+s+\frac{1}{2}} & \text{if } n \text{ is even, } s \text{ is odd, } t = r + s \\ 0 & \text{if } n \text{ is odd, } s \text{ is odd, } t = r + s \end{array} \right\}$$

2- If  $\sigma \in Dj_1(a_{k1}) + \dots + Dj_s(a_{ks}) \dots (5)$ ,  $n$  is odd, then

$$\chi(\sigma) = \left\{ \begin{array}{ll} i^{\frac{(n-1)}{2}} 2^{\frac{r+1}{2}} & \text{if } p \text{ is even,} \\ 0 & \text{if } p \text{ is odd,} \\ 0 & \text{for all other } \sigma \in W(D_n) \end{array} \right\} \text{ . where } p \text{ is the number of } j_k$$

which are odd .

**Proof :**

1- If  $\sigma \in (4)$  , where all the  $i_k$ s and  $j_m$ s are even that is  $Ai_k$  corresponds to a cycle of the length  $(i_k+1)$  , then  $Ai_k, k=1, \dots, r$  corresponds to even cycles, and  $Dj_m$  corresponds to a cycle of length  $j_m$  , then  $Dj_m, m=1, \dots, s$  , thus (4) is an even class iff  $s$  is even , and (4) is an odd class iff  $s$  is odd then :

$$\delta(\sigma) = \left\{ \begin{array}{ll} \bar{\chi}(\sigma) & \text{if } s \text{ is even,} \\ -\bar{\chi}(\sigma) & \text{if } s \text{ is odd} \end{array} \right\}$$

And if  $n$  is even ,  $\chi(\sigma) = 2^{t+s}$ , and if  $n$  is odd ,  $s$  is even ,

$$\chi(\sigma) = \bar{\chi}(\sigma) + \delta(\sigma)$$

$$= 2^{t+s-\frac{1}{2}} + 2^{t+s-\frac{1}{2}} = 2^{t+s+\frac{1}{2}} \text{ , by lemm.(2.3) .}$$

If  $s$  is odd ,

$$\chi(\sigma) = \bar{\chi}(\sigma) + \delta(\sigma) = 2^{t+s-\frac{1}{2}} - 2^{t+s-\frac{1}{2}} = 0 ,$$

2- If  $\sigma \in (5)$  ,and  $n$  is odd ,then if  $p$  is the number of  $j_k$  ,then :

$$\delta(\sigma) = \begin{cases} i^{(n-1)/2} 2^{s-1/2} & \text{if } p \text{ is even ,} \\ -i^{(n-1)/2} 2^{s-1/2} & \text{if } p \text{ is odd ,} \end{cases} .$$

Thus if  $p$  is even ,then:

$$\chi(\sigma) = i^{n-1/2} 2^{s-1/2} + i^{n-1/2} 2^{s-1/2} = i^{n-1/2} 2^{s+1/2} ,$$

And if  $p$  is odd ,

$$\chi(\sigma) = \bar{\chi}(\sigma) + \delta(\sigma) = i^{n-1/2} 2^{s-1/2} - i^{n-1/2} 2^{s-1/2} = 0 ,$$

And for all other  $\sigma \in W(D_n)$  ,  $\bar{\chi}(\sigma) \neq 0$  , then  $\chi(\sigma) = 0$  .
