Abstract

This study reviews the development of research on register variation (RV) in the course of the only remaining century to the present, underscoring the impact of corpus investigations on its most noteworthy advances and furthermore on its significant shortcomings and ambiguities. Looking for viable and valuable techniques to break down language registers, in the second piece of the paper, the creators sketch an alternate way to deal with RV which has been utilized in the course of the most recent ten years in language instructing at college level and expert correspondence preparing. Key words Variation of register _ hypothesis _ theatrical overview

Introduction

Progress in Register Variation (RV) during the last part of the 1980s and 1990s altered and improved the plan of corpora to break down language registers; nonetheless, simultaneously, these new corpus examinations (CA) adapted further advances and attainable uses of RV into language instruction and expert correspondence. New bits of knowledge regularly change the improvement of arising corpora and the other way around. As in many examination issues, this is by all accounts the instance of RV. The current investigation will modify how the primary bits of knowledge inside RV have been denoting the manner in which CA have created and how the plan of these examinations has denoted the constraints and ambiguities this field of exploration at present has. While bringing up these impediments and feeble focuses, we will likewise feature the primary regions of agreement inside this field, as the second point of this paper is to introduce a comprehensive and student well-disposed way to deal with RV which permits scientists to investigate approaches to stay away from past constraints and to search out techniques to dissect registers in a more functional and helpful way.

The aim and the scope

The expression "register", inside the territory of Linguistics, was first utilized by Thomas B. Reid in 1956 (in his article "Etymology, structuralism and philology") and during the 60s register hypothesis burst onto the exploration scene simultaneously as the remove from Systemic Functional Linguistics. RV united as a field of language variety by a gathering of etymologists intrigued by variety as per the utilization, idiosyncratic variety, rather than diatopic variety. Truth be told, the expression "register" frequently exchanged with the expression "ditype" . Their way to deal with RV depended on the prestigious three measurements: "field", "mode" and "tenor" (the last frequently substituted by style of talk") which were around then new and denoted the corpora plan propensities of the next decade. Notwithstanding, inside RV they recognized and frequently likewise covered styles, capacities, points and modes. For instance, Ure (1971) utilized "mode" as a boundary to separate "registers and her corpus is made of 34 spoken and 30 composed writings with a wide range of different sources, from a discussion of two ladies tidying up a space to a radio meeting, and from a school exposition to a distributor's snippet.¹ Chiu in 1973 put together her investigation with respect to enroll minor departure from "mode" and "field" to assemble and examine what she called the register of managerial composition". With a particularly muddled idea of register, the thought of a dependable corpus to dissect RV was as yet powerless and, as of now, these two past examinations dependent on a genuinely huge corpus stood out from different works, for example, the celebrated book by Gregory and Carroll's (1978) - Language and Situation: Language Varieties and their Social Contexts - in view of only one copied discussion between a "nearby bistro representative and his client".

Theoretical overview throughout the C20 up until the present time (the problem)

In the main portion of the C19 experts, for example, Malinowski (1923) and Firth (1935) as of now discussed language assortments subject to the setting of circumstance". Taking a gander at it reflectively, inside the universe of language exploration and phonetics, advancements on relevant variety were concurrent or even before those on printed variety. However, all through the only remaining century, text and kind variety have extended with more noteworthy power and adequacy, nearly immersing or engrossing context-oriented variety. Around then, experts guaranteed the benefit of gathering and investigating regular writings and these underlying - principally hypothetical - works on relevant variety depended on the analyst's own instinct, perception and embodiment of normal English use. Inside them "register" barely showed up and it was not utilized as a different kind of language assortment, being broadly distinguished as "style"; consequently, specialists were breaking down variety reliant on individual decisions (style) along with context-oriented variety (register). The outcome was a significant confined typology which just recognized formal, unbiased and casual variety. This overgeneralizing "threesome" is as yet well known in social and expert correspondence and broadly utilized in the instructing scene. ²Around then, experts asserted the benefit of gathering and investigating regular writings and these underlying - fundamentally hypothetical - works on relevant variety depended on the scientist's own instinct, perception and epitome of basic English use. Inside them "register" barely showed up and it was not utilized as a different sort of language assortment, being generally distinguished as "style", accordingly, analysts were dissecting variety subject to singular decisions (style) along with context-oriented variety (register). The outcome was a significant confined typology which just recognized formal, impartial and casual variety. This overgeneralizing "threesome" is as yet well known in social and expert correspondence and generally utilized in the instructing scene. ³Two noteworthy references in this early period were the works by Ferguson (1959) and Joos (1967). Ferguson stressed the thought of "scale" inside any language's logical variety and the importance of giving an away from between the two closures of these scales: their "high" and "low" assortments. After eight years Joos distributed his book *The Five Clocks* (1967) where "register" was as yet distinguished as "style" and represented with pieces from consistently broad English. Nonetheless, his conceptualization depended on setting" as key boundary which caused him break with the celebrated triplet and recognize five fundamental context-oriented sorts: frozen, formal, consultative, easygoing and cozy. ⁴This notable typology is as yet utilized for instructive purposes and in the most recent decade we can discover considers which actually incorporate this typology. These experts characterize register as "general cover term for situationally characterized assortments related with specific settings or purposes", which are reliant on their clients' language networks. Albeit this idea is as yet expansive and dubious, they as of now consider registers to be bunches of related highlights which tend to co-happen. In this way the examinations of these register highlights are essentially quantitative, in light of the fact that the related register qualifications depend on contrasts in the overall dissemination of phonetic highlights". They support the investigation of huge on-line word references and PC based corpora (for example Earthy colored Corpus, Lancaster-Oslo-Bergen Corpus, London-Lund Corpus), with solid concordance programs and measurable strategies. Be that as it may, these examinations were focused on the distinguishing proof of measurements ("Multidimensional Analysis", MA) inside specific "registers" (which were fundamentally classifications") and in this manner they contracted the idea of register to those measurements and text-types with the aftereffect of exceptionally complex arrangement of register typologies. For instance, the corpus for Biber (1995) investigations 65 phonetic highlights in excess of 30 distinct sorts of "registers". The heading "Press" incorporates "registers, for example, reportage, publications, and audits, or the heading "Scholarly composition" incorporates "registers, for example, regular sciences, medication, arithmetic and "humanities. In these MA, "registers" are broke down and differentiated as far as a wide and heterogeneous rundown of measurements: inclusion versus article (with respect to the content's primary elaboration), on-line versus arranged/incorporated creation (with respect to lexical elaboration, pugnacious versus detailed introduction of data, account versus non-story talk association, attitudinal versus definitive talk, enlightening versus interactional center, logical control versus underlying intricacy, casual communication versus express elaboration, talk tying versus talk fracture, and so on. ⁵Toward the start of this millennium Biber's RV hypothesis creates including more refined PC programming and bigger corpora which unites the expression "register" as an unmistakable phonetic assortment. A portion of their key hypothetical bits of knowledge are that:

a) Register, class and style are viewed as the three crucial utilitarian assortments of language: three particular however reciprocal ideas.

b) Situational highlights of registers are introduced as more fundamental than the etymological qualities. The fundamental test is to set up the connection between situational qualities of register and its particular utilitarian relationship with semantic highlights.

c) Effective register investigations need to follow three pre-imperatives: follow a relative methodology, be founded on a delegate test of writings and utilize quantitative examination.⁶

One of Biber's new experiences has enlivened the ebb and flow research. As indicated by him the contrast between Variationist Corpus Approaches, which offer need to etymological highlights, and Text-Linguistic Corpus Approaches, zeroed in on classifications, has critical ramifications for the general examination plan, the picked factors and the factual strategies applied. Therefore, the significance of register has been more evident in content semantic investigations than in investigations of etymological variety. As referenced in the presentation, new bits of knowledge on kind variety and text semantics have changed the advancement of arising corpora on RV and furthermore arising corpora on sort variety have adjusted new experiences on RV.⁷ The outcome is a very fragile circumstance. Inside the universe of Linguistics, MA's commitment to RV is inestimable; anyway, its effect isn't identical inside the universe of Language Acquisition, Professional Communication or Modern Languages for Specific Purposes. An explanation may be on the grounds that their conceptualization of register is still too loose and still remaining parts covered with different boundaries of examination, for example, classifications, styles, measurements and elements of language. Equivocal and muddled epitomes of hypothetical systems show up in Biber and Conrad (2009) including registers, for example, "easygoing discussion", "administration experiences", "papers" "research article presentations" and "anecdotal composition". "Discussions" and "scholarly composition" are "registers" differentiated in Biber (2012). As Bhatia (2012: 560) brings up: "limits among register and sort appear to be obscured. One may discover this covering or obscuring across register and kind, and maybe somewhat likewise style, to some degree baffling." Another limitation is that their hypothesis' viable application appears to be too mind boggling to possibly be valuable for language understudies, proficient experts and even additionally for language scientists. These days equivocalness and scattering appears to be consistent in RV. The ISO (International Organization for Standardization) delivered in 1999 a norm for enlisting etymological terms (Data Category Registry) which recognized "registers, for example, seat level register, lingo register, clever register, formal register, in house register, unexpected register, impartial register, slang register, no-no register, specialized register and disgusting register. To help understudies, a gathering of language speakers is as of now attempting to project some light into this issue from alternate points of view. For instance, from a MD's viewpoint, Aguado et al. (2012) have as of late attempted to investigate "the utilization of multidimensional examination of student language to advance register mindfulness".⁸ They gathered a corpus from meeting 59 nonnative understudies and 28 local speakers to investigate measurements, for example, individual account, relational correspondence and picture portrayal. The investigation follows Biber (1988) and Conrad and Biber (2001) insightful method and utilizations an intriguing examination device created by their own group called CRAT (Corpus Research Analysis Tool). On these lines, one of the fundamental future difficulties of RV's hypothesis is to discover more commonsense strategies to advance register mindfulness among proficient correspondence students and general language students. Any individual who needs to discuss the numerous assortments of a language is quickly confronted with extreme issues, the underlying signs of which are to a great extent phrased: customary language utilizes the word style to cover a wide range of sorts of assortments - the style of Henry James, formal style, the style of jokes, paper title text style - while various etymologists have utilized a variety of specialized terms in differing and covering ways. Our first intention is to recognize a few crosscutting measurements in the examination of phonetic assortments; the differentiations we make are, all in all, natural from the writing on stylistics and sociolinguistics, however the particular terms we have picked address our own determinations from the accessible stock.⁹ In any case, we recognize those parts of discourse that are related with distinctive individuals or individual events, and those related with classes of individuals or classes of events - that is, we might want to isolate peculiar variety and parts of specific exhibitions from the more precise relationship of etymological highlights with social gatherings and settings. These more precise affiliations are of various sorts. In one kind, we find etymological highlights in 'relationship with comprehensively characterized natural, social and mental conditions' of speakers (Giles, Scherer and Taylor 1979:343) - with so much factors as age, sex, ethnic gathering, social class, provincial beginning, occupation, character, convictions and perspectives. To the extent that such an affiliation includes various semantic highlights in covariation, particularly highlights of various sorts (from segmental or prosodic phonology, vocabulary, morphology, grammar, talk structure, or the arrangement of orthographic portrayal), etymologists have been slanted to utilize the mark lingo, preferably 'an ongoing

assortment of a language, ... set off from any remaining such constant assortments by a remarkable mix of language highlights'. Yet, plainly language highlights filling in as 'discourse markers' (Giles, Scherer and Taylor 1979) don't really group into trademark sets, so that there is a continuum from worldview occasions of tongue to instances of a couple of highlights related with properties of speakers.¹⁰ Before we leave the subject of vernacular and related wonders, we ought to explain what comprises a relationship between a phonetic element and something nonlinguistic; this record will at that point fill in as a model for our later conversation. Our place of flight is the recognizable assumption of stylistics that a specific assortment of language includes a bunch of decisions, or choices, from the methods for articulation accessible at all degrees of construction in a language; each such decision characterizes a relationship between a semantic element and the conditions wherein this decision is made. We see three sorts of determination at work, relating generally to what Freeman (1970: introduction.) has depicted as three distinct accentuations in the investigation of artistic style:

(1) the choice might be, for example, to prohibit certain highlights from the assortment being referred to, so the assortment can be portrayed (according to the perspective of different assortments) as a limited type of language, or as displaying unique conventional limitations;¹¹

(2) the choice might be, for example, to allow certain highlights in the assortment being referred to, so the assortment can be depicted (according to the perspective of different assortments) as indicating extraordinary opportunity in its methods for articulation, or as having freak highlights; and (3) the choice might be, for example, to support a heavenly body of specific structures over others in the assortment being referred to, with the goal that the assortment can be portrayed again according to the perspective of different assortments) as demonstrating a factual inclination for specific methods of articulation. In the investigation of vernaculars, these three kinds of choice show up as contrasts between a given lingo and some self-assertively picked reference tongue. Along these lines, if Black English is contrasted with the 'standard' American English, of, say, Chicago, it shows each of the three kinds of determinations: (1) the article pronoun whom is prohibited; (2) he may show up in limited action word settings, as in He be wiped out, a development unrealistic in the norm; and (3) past amazing action word structures (for some, speakers) happen more much of the time than they do in the norm, so I had thought it was simple may show up in settings where the basic past would do also. We presently abandon assortments related with properties or conditions of speakers to those related with the connections among speakers and their conversationalists or crowds: the components of closeness/distance, easygoing quality/convention, respect/predominance, authoritativeness/respectfulness, consideration/negligence, and maybe others. Here we follow Stevens and others in limiting the name style so it alludes just to this kind of assortment. Firmly identified with styles, yet connected with explicit settings or circumstances and with explicit elements of language in those specific circumstances, are those assortments for which we save the term register; 'for circumstance explicit use, the British expression register has acquired acknowledgment'. The limitation to explicit capacities will in general be stressed in the writing on stylistics and sociolinguistics; 'A register in a given language and given discourse local area is characterized by the utilizations for which it is suitable and by a bunch of primary highlights which separate it from different registers in the all-out repertory of the local area'; 'a utilitarian style [register] is an arrangement of interrelated language implies which serves a clear point in correspondence'¹².

The hypothesis

To look at the composed content (WS) to the oral exhibition (OP), certain decisions needed to be made concerning record of the OP, especially with respect to accentuation (83.3) and parsing the content into sentences. In my craving to give some sign of the size of the corpus, it was important to check statements rather than words, depicts the strategy utilized for recording the changes, §3.2 talks about pronoun arrangement show, and clarifies the employments of the combination wa 'and' in Arabic,

1. Recording the progressions

The progressions between the WS and OP were recorded in an equal table utilizing hues featuring for the different kinds of changes. Table 2 underneath shows red featuring for erasures, green for augmentations, yellow for lexical replacements, dark for compressions and pink for word request changes. The left-hand section gives the WS and the right-hand segment shows the OP. Each column contains another discourse demonstration which is either performed by the storyteller or another entertainer. These discourse demonstrations range long from single word to a whole passage. In this investigation, each new discourse act will be alluded to as a line, especially concerning the storyteller lines. The direct discourse of different entertainers will be alluded to by 'line' or 'conversational turn'. Each line has three lines, the first containing the first Arabic content, the second

containing an expansive phonemic record and the third containing a free interpretation of the discourse demonstration. Hued featuring interfaces the significant change in the English and Arabic sort. The phonemic record in Table 2 is appeared here for comfort. The recorded changes in Appendix A lone showcase the Arabic content and the free English interpretation.¹³

2. Punctuation

MSA accentuation is like English accentuation in that periods, commas, shout marks also, question marks are utilized for fundamentally similar purposes. In any case, BA composed accentuation isn't also dug in as MSA in light of the fact that BA isn't ordinarily utilized for composing. In the contents, a period is for the most part used to end a line of direct discourse or a storyteller's passage. It isn't generally used to stamp the finish of a sentence, rather writers writing in informal Arabic will in general utilize ellipsis (three dabs) to check the finish of sentences inside a section. Ellipsis might be utilized to mean a speaker following off as in English or a delay or faltering in direct discourse, yet it isn't by and large used to check an exclusion in the composed contents. Despite the fact that it is now and then used to separate compound provisos inside a solitary sentence, it is essentially used to isolate sentences inside a passage.¹⁴ As will be examined further in §3.5, it tends to be troublesome in BA to isolate statement from sentence, so the utilization of ellipsis can confound this issue further. In Al Batal's investigation of Lebanese Arabic (1994), the ellipsis can be deciphered as a period, a colon, a semi-colon, a comma or an ellipsis, which delineates the liquid idea of this accentuation. In model (2) So1.42, there are three circles in the WS that convert into English: the initial a comma, the second a period and the third an ellipsis that addresses an interruption in the verbally expressed content, be that as it may, could likewise be translated as a comma in the composed content.

The value

Getting back to the idea of register, we should remark momentarily on a class of marvels which look like registers in having related with them a bunch of trademark semantic highlights, however which contrast from them in not being firmly related to explicit settings as well as employments. What we have at the top of the priority list here are such phonetic schedules as stanza structures, mystery dialects, conundrums, maxims, and bigger classifications, both conversational and abstract. Numerous schedules are prominently 'extralinguistic', in that the standards administering them (metrical prerequisites, rhyme, customary disfigurements) are not normal for common guidelines overseeing etymological construction (see Sherzer 1976 on mystery dialects and Bierwisch 1970 on wonderful structures). Many are organized as expected; they have a start and an end, and an example to what in particular divides. Some are obtained through cognizant guidance instead of implicitly. All are conveyed, as designs, as parts of bigger talks, inside which they may serve an assortment of closures. They are unmistakable from lingos, styles, and registers, since they might be outlined in different vernaculars, styles, or registers: a rhyming couplet in poetic pattern can show up in the English of El Paso or Liverpool, in conventional style or in easygoing style, in child talk or feature register. Schedules are subsequently exceptional kinds of talk structures (like inquiry answer matches or welcome and goodbye services) and may well not establish a rational subclass of such designs; we notice them here on the grounds that the way that they are customarily connected with limitations on semantic structure, degenerate structures, or potentially factual inclinations for certain phonetic structures implies that they are effortlessly mistaken for registers.¹⁵ Our structure for review the methodical traditional relationship of phonetic highlights with social gatherings and settings at that point includes four significant measurements - vernacular, style, register, routine - which are on a fundamental level autonomous of each other. In a given language and culture there will be numerous huge interrelationships among the constructions orchestrated along these four measurements, obviously: a specific lovely structure, for instance, might be unbendingly connected with a specific tongue and style. We know that however our plan isn't especially novel, recognizing the measurements from each other can be troublesome now and again, and separating structures from each other along one measurement - exactly what number of styles or registers are there in English, and what right? - is honestly vexing, however we desire to have given a structure in which the clearest and most fascinating cases can be obliged.

Background Issues

The motivation behind this investigation is to record and talk about changes that happened between the composed contents and the oral exhibitions of those contents of performed Biblical stories in Baghdadi Colloquial Arabic (BA). On the off chance that we unload that assertion, a few issues promptly ring a bell. Composed contents and oral exhibitions bring to consideration not just the undeniable issue of composed versus spoken registers, yet additionally the broader issue of education versus orality.¹⁶

The procedures

Phonetic changes between the two mediums welcome talk and sociolinguistic components into play. Making an interpretation of Biblical stories into BA involves issues of exposition, diglossia and codeswitching. This section tries to sum up a portion of these issues and characterize terms as they have been utilized in past studies and how they will be utilized in this investigation. Lamentably these issues are fundamentally interwoven and can be hard to examine in segregation, thusly some reiteration might be difficult to evade. This section starts with the broadest issue of education versus orality, followed by a conversation on diglossia and the correlation of composed and spoken registers in §2.3. presents the thoughts of union and topic as they identify with the discoveries in this study. §2.5 and §2.6 examine the talk subjects of connectives and reiteration in Arabic.¹⁷

Contextual analysis: verb register variety

To guarantee manageability for this examination, two sub corpora were made from CALM: (1) the Movies sub corpus, comprising of records from motion pictures (113,163-word tokens) and network shows (115.236-word tokens), for a sum of 228,399-word tokens including 38,768 action words, and (2) the Blogs sub corpus, containing 141.318-word tokens and 27,616 action words. While not actually adjusted, they are of sensibly equivalent size. For this investigation just the action words were explained, to some extent since they are marginally simpler to distinguish and comment on than things and modifiers, and as a result of their broad use in deciding register. Table I gives test comments for a few verbal highlights. In this segment, at that point, we play out a register variety examination on action word highlights to describe the two components of substance in CALM: oral versus educated (or spoken versus composed), as addressed by the Movies and Blogs sub corpora, separately. The initial step was to clarify every action word in the two sub corpora. When every action word was doled out a grammatical form tag, a verbal class, and a lemma, every one of these highlights were tallied from each sub corpus and contrasted all together with decide if action words are utilized in an unexpected way. Since the size of the two sub corpora was not the very same, tallies from each were standardized. We utilized two measurable tests to process importance: (1) loglikelihood on account of its regular appearance in corpus etymology contemplates; and (2) the Bayesian Information Criterion (BIC) for its dependability over chi square when managing word tallies that fall on one or the flip side of the recurrence range. Action words are more normal in the Blogs sub corpus than in Movies (see Table 2). In any case, not all verbal classes (IMPERFECT, PERFECT, IMPERATIVE, HABITUAL, and FUTURE) in Blogs happen more as often as possible than in Movies. Table 3 shows the classification contrasts, which are all genuinely huge aside from FUTURE. In any case, a portion of these distinctions change when we contrast recurrence with the aggregate sum of action words in every corpus instead of the absolute number of words. This is a direct result of the higher grouping of action words in Blogs, causing checks of the verbal classes removed from the all-out number of words to be deceiving. all IMPERATIVE verbs. Only the positive 2SG.FEM.IMPERATIVE remains more frequent in Movies regardless of its comparison set. Another feature used to prove register variation is lemma frequency across verbs from each register. Among the verbs that occur in either sub corpus with a frequency of over 100, seventeen verbs show a frequency significantly higher in one register over the other. The frequencies of IMPERATIVEs in Movies are altogether fundamentally higher than in Blogs aside from the positive 2PL.IMPERATIVE. Nonetheless, the table uncovers that as a level of the absolute goals utilized, the Blogs utilizes the positive 2SG.MASC. IMPERATIVE and positive 2PL.IMPERATIVE altogether more than Movies. Negative basic use is essentially more noteworthy in Movies contrasted with all action words, however not fundamentally more prominent when contrasted with lexical diversity counts

Common		Blogs	
اتفضل	please ,come in	بدأ	to begin
خش	leave	كتب	to write
هدى	to calm oneself	حاول	to try
أكل	to eat	دخل	to enter
سأب	to leave	حس	to feel
استنتي	to wait	لقي	to find
اشرب	to drink	فتح	to open
امشي	to walk	رد	to respond
		قرأ	to red

statistics for each register are given in the table . All differences displayed are statistically significant, suggesting that Blogs is richer in verb types as well as in verb diversity.

Conclusion

This examination endeavored to recognize the composed spoken measurement from diglossia factors by utilizing sensational talk which gives an equal verbally expressed book to the composed content, both of which were made utilizing Baghdadi Colloquial Arabic. Past investigations that contrast composed with communicated in Arabic, are not as a rule at the equivalent diglossia level. As expressed over, one would not anticipate, diglossic changes to happen between the WS and OP in light of the fact that the scriptwriter made careful arrangements to thoroughly consider the diglossic level of each open circumstance in the accounts. In any case, regardless of the scriptwriters' earnest attempts, the entertainers made diglossic replacements as they were playing out the OP. These progressions were persuaded by the more prominent attention to the tenor of the text emerging from ongoing discourse occasions that expansion the emphasis on association in the talk.

While replacements will in general be diglossically inspired, augmentations and cancellations for the most part emerge from the adjustment in mode. We noticed that the emotional sort has two sub-registers: portrayal and direct discourse. In the move from written to spoken content, these sub-enlists each mirror the utilization of an alternate contribution system: portrayal utilizes wa-erasure and direct discourse utilizes redundancy. These techniques were utilized in the oral execution to build union and passionate effect, especially in the utilization of literary and relational connectives. Past examinations (scc § 2.5) show that wa is utilized less as once moves from the composed channel to the verbally expressed channel. Al Batal's investigation on connectives likewise made the case that a zero connective exists in Arabic. Toward the finish of his examination, he made a few proposals for further research, two of which identify with the flow study

Future research

In view of the research presented here, register variation is still a field of study that requires further advancement based on the use of corpora and the refinement of parameters in register description. Obviously, register variety research has prompt applications to unknown dialect instructing and intercultural correspondence, and this kind of point of view that the field offers ought to draw in researchers and correspondence experts. Future lines of exploration ought to think about other open settings, for example, agreeable and family settings, as no examination worried about these circumstances has been directed to the most amazing aspect our insight. There are two parts of exploration on register variety that are particularly significant in our view: a nearby cooperation among researchers and local speakers, and a thorough plan of corpora, where an exact ID of setting and members' jobs ought to take into account the making of completely agent corpora, and guarantee solid examination results.
